

# 3<sup>rd</sup> International Conference on Forensic Research and Technology

October 06-08, 2014 Hilton San Antonio Airport, USA

## Standards, protocols and globalization of forensic odontology

Alan Diego Briem Stamm

University of Rosario, Argentina

A disaster is an unexpected event that causes death or wounds to a high number of persons and the condition of the bodies originates serious difficulties for the identification. The promotion of teams has been recommended for these procedures (DVI), always under protocols and standards recognized internationally. Since the teeth and its restorations can resist highly unfavorable conditions, the Forensic Odontology has played a key role in the identification of great number of victims. Though there are several different protocols for these cases, those of Interpol have turned out to be efficient on having demonstrated the need of expert and qualified odontologists integrating the DVI teams. Even if different trends and opinions have been described in the matter, it is clear that singular situations have promoted the problems of slanted conducts in the application of the odontology in the processes of identification. In this talk a review of some catastrophes from the odontologic forensic perspective is presented and proposal is made of the adhesion to a constant education, to the recognized internationally standards and to the adoption of global philosophies that it keep attentive to the requirements of the function that involves the expert odontologist.

### Biography
