Role of immunization in prevention of nosocomial infections

Zarema Obradovic
University of Sarajevo, Bosnia and Herzegovina

Background: According to the Law on Protection of people from infectious diseases (Official gazette of the Federation of Bosnia and Herzegovina, number 29/05), article 2, paragraph 8: "Nosocomial infection is an infection that occurs during the providing of health services in a health care institution or at the provider in a private practice”. Affected are patients, people employed in health care institutions (health care and non health care workers) and visitors. There are different prevention measures that are used in practice and their implementation depends on behavioral changes of each individual related to this problem. Immunization is in the group of measures that are partially legally required for health care workers and partially are recommended. Hepatitis B vaccination is legally required for all health care workers in Bosnia and Herzegovina. Other vaccines among which there are the vaccine against influenza, varicellae, morbilli, rubella and parotitis (MRP), are recommended because of the specificity of work in some high risks departments (hematology, oncology, and neonatology).

Objective: The aim of this study is to present the situation in Bosnia and Herzegovina according to the immunization of health care workers against hepatitis B, influenza and other vaccines as preventive measures in prevention of nosocomial infections.

Material & Method: A cross-sectional study was carried out involving health care workers in different clinics in Clinical Centre University of Sarajevo. We used the questionnaire created for this purpose.

Results: Because of insufficient control of the vaccinal status and sometimes inadequate awareness of the health care worker, the percentage of non vaccinated health care workers is quite high and is about 20-40%. The vaccination coverage for other vaccines is worse and for influenza is between 5-10%. There are significant differences between departments and between different groups of health care workers.

Conclusion: Immunization as a preventive measure for prevention of nosocomial infections in not enough respected among health care workers in Bosnia and Herzegovina and needs to be improved in the future.

Biography

Zarema Obradović is an Epidemiologist, currently working at the Epidemiology Department of Institute of Public Health Canton Sarajevo and as a Professor of Epidemiology at the Faculty for Health Studies, University of Sarajevo. After completing her studies at the Medical Faculty, University of Sarajevo, she completed the specialization in epidemiology in 1990.
