

# 3<sup>rd</sup> International Conference on Hydrology & Meteorology

September 15-16, 2014 Hyderabad International Convention Centre, India

## Impact of climatic vulnerabilities on Indian mountain rivers

Rabindra Nath Barman<sup>1</sup>, Pankaj K Roy<sup>2</sup> and Asis Mazumdar<sup>2</sup>

<sup>1</sup>National Institute of Technology, India

<sup>2</sup>Jadavpur University, India

Potential climate change impacts on hydrology pose a threat to water resources systems throughout the world. Changes to the present climate system may affect a variety of eco-systems, socioeconomic sector and industry in addition to water resources. Analysis, with long term historic data shows increase as well as decrease in temperature and rainfall. The course of variability is significant at some places, because of which a wide range of variation takes place from year to year. Analyses of historic weather data sets indicate rising temperature trends in most locations, with large year-to-year seasonal and annual variation around the trend line. Thus, it is obvious from the studies in this area with rainfall and temperature that the understanding of the climate variability is a difficult task. The vulnerability analysis is a method to analyze the response of a system to uncertain events or “hazards”. The example of uncertain events includes floods, droughts, earthquake, tidal wave, dam failure, environmental hazards etc. River basins are generally plagued by uncertain events like floods and droughts. Prolonged droughts increases water stress and aridity in the watersheds again floods would result in wastage of available fresh water. The present research is an attempt to use distributed hydrological modeling to identify the impact of such vulnerability on Teesta river system situated in the northern part of West Bengal. The vulnerability was calculated based on water availability, virtual water, water footprint, green water and water sequestration. The results may identify and educate natural resource managers about the regions which are most vulnerable to climate change.

### Biography

Rabindra Nath Barman has completed his PhD at the age of 33 years from Jadavpur University. He obtained his BE degree in Mechanical Engineering in 2003 from the Jadavpur University, Kolkata, India. He also obtained his Master of Engineering (ME) degree through GATE qualifying examination in 2005 from the same Institute. He has over 10 year's research experience in water resources & hydraulic engineering. He has published more than 30 papers in reputed journals and serving as reviewer on several reputed journals. He is the principal co author of the two Springer monographs. He is also a project investigator of two prestigious research projects DST and AICTE. He filed 3 US patents. He is the supervising of more than half dozens of PhD candidates. In August 2010 he was appointed Controller of Examinations of the National Institute of Technology, Agartala and in January 2011 he was appointed Faculty In Charge School of Hydro- Informatics Engineering, National Institute of Technology, Agartala.
