Colonic stenting for malignant intestinal obstruction is a safe and effective method for bridging to surgery and palliation

Ernest Jehangir
North Cumbria University Hospitals, UK

Colonic stenting using a TTS delivery system is a safe and effective means of treatment for intestinal obstruction caused by adenocarcinoma in the acute or urgent setting. It can be used as a bridge to surgery effectively converting an emergency open operation to an urgent laparoscopic resection. It is very effective in treating colonic obstructions in the palliative setting. This 12 year experience of nearly 100 cases show that it can be achieved in a District General Hospital and one of the highest series in the UK.

Biography

Ernest Jehangir had completed his undergraduate medicine at the Christian Medical College Vellore, India and post graduate surgical training in Newcastle, UK. He is a colorectal surgeon and served as the surgical tutor and clinical tutor.
