Sporadic benign recurrent intrahepatic cholestasis: Diagnosis in adulthood

Vamseedhar Annam¹ and Shivanand Murgod²

¹Mamata Medical College, India

²Fortis Hospital, India

Benign Recurrent Intrahepatic Cholestasis [BRIC] is a rare autosomal recessive disorder characterized by recurrent cholestatic attacks with symptom free intervals. The attacks can start at any age but the first attack is usually seen before second decade of life. The onset and resolution of which are caused by unknown factors. Association of BRIC with acute recurrent pancreatitis though recognized is very rare. We here report the two cases of young adults with age 19-year-old and 22-year-old presenting with recurrent attacks of hyperbilirubinemia and cholestasis in association with gallstones and acute recurrent pancreatitis. The gallstones were not the cause of pancreatitis.

Biography

Vamseedhar Annam completed his DCP and MD degree in Pathology from Rajiv Gandhi University of Health Sciences. He has received honor and awards for innovative research works in cytopathology and histopathology. He is a distinguished Professor [Pathology] and Research Advisory Board Member at Mamata Medical College [NAAC accredited A grade Medical College] affiliated under Dr. N.T.R University of Health Sciences, Vijayawada. He has more than 40 publications in the form of original articles, review articles and case reports in the field of Oncology and Infectious diseases in various indexed journals like *Journal of Gastrointestinal Cancer*, *Indian Journal of Cancer*, *Cytojournal*, *Indian Journal of Pathology & Microbiology*, *Journal of Biomedical Sciences*, etc. Currently, he is working on predictive and prognostic markers in colorectal cancers.
