“Opening up” about renal artery stenosis

Ajay Srivastava
Mercer University School of Medicine, USA

Renal artery stenosis is a finding whose prevalence is highly dependent on the population that is being studied. Nonetheless, even in those with significant peripheral vascular disease, a finding of atherosclerotic renal artery stenosis may not necessarily warrant interventional treatment. Unfortunately, the treatment of these lesions remains unclear with the available randomized trials and meta-analyses. This lecture will discuss and attempt to provide clarity for the evaluation and management of renal arterial stenosis in the context of the current evidence-based data and most recent treatment guidelines.

Biography

Ajay Srivastava completed his MD at the University of Texas Medical Branch and his subsequent residency training in Internal Medicine and fellowship in Nephrology at the University of Rochester Medical Center. He is an Assistant Professor of Medicine and Chief of the Division of Nephrology at Mercer University School of Medicine.
