Evaluation of Stress Level of Railway Workers

Aslıhan ÖZTÜRK and Ayfer TEZEL
Ankara University, Faculty of Health Sciences, Nursing Department, Turkey

Evaluation of Stress Level of Railway Worker: The work stress is a psychological issue that restrain person from normal functions, changes psychological and physical attitudes, comprises of consequences of factors related to work. The business climate is convenient to stress. People spend most of their time in workplace so it is needed to evaluate employees’ stress related to work. This study was conducted to evaluate work stress of Turkish State Railways employees. The study type is descriptive and sample of the study consists of 322 workers who work State Railways of the Turkish Republic in Ankara. Data was collected by using Personal Information Form that prepared by researchers. Data is analysed by using descriptive statistics and chi-square (X2) test. All of employees are male and 93.2% of them are married. Approximately half of workers (61.5%) are high school graduates and 56.8% of them have intermediate income and their income is equal to their expenses. It was found that relation between age educational level work year industrial accident opinions about working conditions work satisfaction the idea of job change feeling in the workplace with work stress is statistically significant (p<0.001). Statistically significant relation was not found between staff status, working hours with work stress (p>0.001). At the end of the study, between stress level of the workers with work conditions and personal characteristics was found relationship. It was determined that workers were unable to cope efficiently with stress. Training about interpersonal relationships, communication skills, coping with stress etc. should be given to employees.
