What to do for TMD in children: A neuromuscular perspective

Neuromuscular dentistry is the understanding of the relationship between the temporomandibular joints (TMJ), teeth, muscles and nerves. It enables the optimum physiologic position of the jaw to be established to assist in the correction of the underlying causes of craniofacial – Temperomandibular joint, head and neck pain. Neuromuscular dentistry is also used to determine the optimum physiologic jaw position prior to complex dental restorative procedures, cosmetic dentistry, dental sleep medicine procedures, dentofacial orthopedics and orthodontics. It is a treatment modality of dentistry that focuses on correcting the physiologic “misalignment” of the jaw at the Temperomandibular joint (TMJ). TMJ disorders are not a problem limited to adults. This lecture focuses on how to diagnose and treat TMD in children and young adults. Neuromuscular-functional orthodontics is an easy error free procedure that will take the practitioner to treat TMJ dysfunction in children during interceptive therapy.

Biography

Fabio Savastano was graduated in Medicine and Surgery in 1987 cum laude at University of Naples, Italy. He received Master in Orthodontics at the University of Padua in 1990. He is the Adjunct Professor at the University des Les Valls, Andorra. His practice limited to Orthodontics and Gnathology since 1991 in Albenga. He is the President of ICNOG, International College of Neuromuscular Orthodontics and Gnathology and International member of the AAO, American Association of Orthodontics. He is the member of numerous associations and has lectured in Brazil, Canada, UAE, Spain, Bahrain, India and Italy on “Neuromuscular Orthodontics”.
