Complications during Maxillary Sinus augmentation

Dilip Stewart
Ilili Dental Spa and Implant Center, India

Posterior maxilla usually is a hindrance for placing dental implants due to pneumatization and minimal availability of bone due to resorption process which take place after extraction of teeth. Maxillary Sinus augmentation is a predictable treatment modality by which we can create space for placing implants. But during Sinus augmentation by lateral window technique different complications arise such as membrane perforation, Septa, bleeding etc. The purpose of this lecture is to show how such complications can be treated when encountered.

Biography
Dilip Stewart has completed his BDS at the age of 25 years from Dr. MGR University, Chennai, India and then has been practicing as a general dentist and also as an implantologist in Ilili Dental Spa and Implant Center, India.
