Theoretical study: Non-small cell lung cancer drugs

Ulku Dilek Uysal and Halil Berber
 Anadolu University, Turkey

Afatinib, crizotinib and ceritinib (Figure 1) have been used as a treatment for non-small lung cancer in recent years [1]. To the best of our knowledge; there has been no theoretical research about these three non-small cell lung cancer drugs in the literature. The theoretical investigation of these molecules is an urgent need to understand the residence mechanism of these drug active components.

Biography

Ulku Dilek Uysal has completed her PhD in 2001 from Gazi University and postdoctoral studies from Institute of Chemical Technologies of Italian National Council of Research (CNR). She is professor of Anadolu University at Chemistry Department. She has published more than 25 papers.
