Theory and application practice of the binary mixtures sol-gel transition concept for fire and explosion prevention

Denis S Kuprin and Gennady N Kuprin
Saint Petersburg State University, Russia

Accidents and catastrophes with fires and explosions including accidents at facilities with hazardous chemicals are getting the global problem. These problems are getting more dangerous because of the high probability of the terrorist attacks connected with hazardous chemicals application. The new technology of the accelerated accident liquidation in the case of chemical and radiation dangerous materials opened appearance risk is presented by the manuscript authors. Experience of application of the new patented binary mixtures sol-gel transition technology is described as applied for fire and explosion prevention, solid combustible materials and explosives fire-extinguishing, chemical protection and others.

Biography
Denis S Kuprin, head of the laboratory of fire and explosion prevention, graduate of the Saint Petersburg State University. He is a co-author of the invention concerning generation and application of fast-hardening foam based on the structured silica particles. He is the author of publications concerning the main concept of the sol-gel transition for the creation of fire-extinguishing foams which are intended for fire and explosion prevention, heat protection, screening in the case of accidents with radiation and hazardous chemicals and others.
