Transabdominal sonography of the gall bladder and its hepatic and peritoneal perforations

Vikas Leelavati Balasaheb Jadhav
D. Y. Patil Vidyapeeth, India

Transabdominal sonography of the gall bladder can reveal hepatic and extra-hepatic and peritoneal perforations of the gall bladder, whether it is impending perforations, frank perforations, sealed perforations, concealed perforations and its complications. It can also demonstrate adhesions in the gall bladder fossa at the right upper quadrant. All these cases are compared and proved with gold standards like laparoscopic and open surgery and endoscopy. Some extra efforts taken during all routine or emergent ultrasonography examinations can be an effective non-invasive method to diagnose primarily hitherto unsuspected gall bladder impending perforations, frank perforations, sealed perforations, concealed perforations and its complications, so should be the investigation of choice.
