Emerging issues in the construction industry: A critical review of past and present trends

The construction industry is continuing to grow and its contribution to GDP reaching a high of 784.1 USD Billion in 2016 (Bureau of Economic Analysis (BEA), 2017). The construction industry is constantly changing with improvements to technology, safety, the environment, and economics. As one of the leading industries, employers are striving to make new advancements in the field (BEA, 2017). The objective of this paper is to systematically review the current literature on trends in the construction industry. An in-depth review of construction management articles was conducted to determine what issues and trends are emerging in the construction industry. The literature review found an array of articles on topics such as technology, safety, the environment, and economics. After determining the important issues and trends, a review was conducted to discuss how the construction industry is adapting to these changes. As the world continues to evolve with the changing economy and environment, the construction industry needs to continue to keep up with these changes. Recommendations are provided based on the review for future growth and trends of the construction industry.
