The study examined Nurses handover and its implication for nursing care in University of Calabar Teaching Hospital (UCTH), Calabar. The nurses' shift changes or handover is a key moment for guaranteeing the continuity of care and the patient's safety. The study sought to examine the various aspects of handover common to nurses, identify the factors influencing Nurses handover and examine the implication of Nurse handover on patients care in UCTH. A null hypothesis was also formulated; there is a significant positive relationship between nurse handover and patients care in UCTH. The study employed a descriptive survey design. A sample size of 94 respondent was used for the study. A well-structured questionnaire was used to elicit information from the respondents. Data analyzed was presented in simple frequency tables and percentages while the hypothesis was tested using the Pearson Product Moment Correlation Coefficient at 0.05 level of significance. Findings revealed that majority of respondents, strongly agreed that transfer of information from one shift to the other is an important aspect of nurse handover 38(44.70%); communication is a vital element in the handover process 38(44.7%). The study further revealed that handover enhance nurses' and patients family relationship 38(44.7%), handover can be used as a tool for improving communication in nursing care 34(40.0%). It was also revealed that there is a significant positive relationship between nurse handover and patients care in UCTH. The study concluded that the handover process is characterized as being a routine, daily event that is performed in the morning, afternoon, and night, and recommended the need for regular updates among practicing nurses to enable them acquire special skills that will enhance better communication during handover, as well as re-emphasizing of nurse handover as a vital procedure in the training curriculum of student nurses.
