Critical care nurses and relatives of elderly patients in intensive care unit- Ambivalent interaction

Abderrahim Akroute
Bodø Hospital, Norway

The main objective was to explore the experiences of CCNs in relation to relatives of elderly patients, 80 years and older admitted to ICU. Through methods grounded in phenomenology, six CCNs were purposefully selected for their experiences with relatives of elderly patients admitted to an ICU in Norway. Each CCN participated in the semi-structured personal interviews. Using content analysis, interviews were coded and categories and themes were identified. An overall theme emerged: “CCNs ambivalent interactive struggle with the relatives of elderly patients”, which reflected the mixed feelings that CCNs recalled having towards relatives. Two themes emerged during the analysis. Those were: “relatives are a resource for CCNs and the patient”; and “relatives are seen as challenge”. Six sub-themes were identified: CCNs are relying on relatives, relatives and their understanding of the situation, relatives are committed, relatives have high expectations, relatives can be seen as burden and relatives with cultural differences are a challenge. CCN's experiences with the relatives of elderly patients in ICU represent a significant personal, mixed struggle. The findings indicate that development of communication, education, reflection and a more structured organization of intensive care unit can improve results for CCNs and may improve the possibilities for CCNs to promote an excellent family nursing for the elderly patient and his relatives.

Biography
Abderrahim Akroute graduated as a Nurse from Universitet and has completed his Master’s degree in Clinical Nursing. He is currently working as CCN at Bodø Hospital, Norway. His research interests pertain to the experiences of families of elderly patients in ICU and Ethics.
