Cancer has reached such portions now that Medical News Today stated that in the USA alone 1 in 2 women and 1 in 3 men will develop cancer in their lifetime. What has changed in the past 100 years that so many are getting cancer? The answer is basically because we are now literally living in a toxic soup. In North America alone, there are more than 77,000 chemicals being produced with more than 3,000 chemicals added to our food supply and more than 10,000 chemicals in the form of solvents, emulsifiers and preservatives that are used in food processing, packaging, wrapping and storage. 3000 chemicals can be found in one cigarette. The EPA estimates there are more than 20,000 chemicals that our bodies cannot metabolize causing untold damage. In addition our bodies are assaulted by electrical pylons and cell phone tower frequencies on a constant basis. Our environment also exposes us up to dangerous xenoestrogens (xeno meaning foreign) from the chemical estrogens all around us. Things like herbicides, pesticides, the amalgam (silver) fillings in our teeth, antiperspirants and certain types of plastics, such as thin cling wrap type of plastics people often use to wrap their sandwiches and foods in, to name just a few. The late Dr. Hulda Clark who specialized in treating cancer found that her patients had isopropyl alcohol in their liver and she considered this industrial rubbing alcohol as one of the major toxins causing cancer.

Biography
Lloyd Jenkins has completed his BA with Warnborough University of England, UK and his Master’s in Education and Doctorate in Natural Health Sciences was completed with St. Petersburg State University. He has graduated cum laude with a major in Cancer Research to earn his PhD. He is a Naturopathic Doctor who has written seven books on natural health and emotional wellbeing and several articles for a local newspaper on complementary health subjects and has been interviewed several times on radio stations in USA and Spain.
