Women, trauma and alcohol dependency: Connections and disconnections in alcohol treatment for women

Binod Kumar Yadav
Nepal Association For Medical Laboratory Sciences, Nepal

Women with alcohol dependence and PTSD with a history of IPV want help however the health and social services do not always recognize their calls for help or their symptoms of distress. Recommendations are made for treatment centers to become trauma-informed that would help this recognition. Women who have experienced Intimate Partner Violence (IPV) are at greater risk for physical and mental health problems including Post Traumatic Stress Disorder (PTSD) and alcohol dependency. On their own IPV, PTSD and alcohol dependency result in significant personal, social and economic cost and the impact of all three may compound these costs. Researchers have reported that women with these experiences are more difficult to treat; many do not access treatment and those who do, frequently do not stay because of difficulty maintaining helping relationships. However, these women's perspective has not been previously studied. The purpose of this study is to describe the experience of seeking help for alcohol dependency by women with PTSD and a history of IPV in the context in which it occurs.

Biography
Binod Kumar Yadav is working as a President at Nepal Association For Medical Laboratory Sciences in Nepal.
