Acute stroke care and management – a case study

Stroke Care and Management continues to change and develop. There are medications that are used to treat acute strokes, including but not limited to thrombolytics, anti-hypertensives, anti-platelet medications, anti-emetics, as well as specific IV medications. There are also goals of care to establish, determine, as well as definitive care. The case study is a 77 year old female who was administered the wrong thrombolytic agent, and had an adverse outcome. This presentation will help educate the importance of the right medications for acute non-hemorrhagic stroke.

Biography
Chad D Rasmussen has completed his BSN in 1996 from Morningside College, and his Master of Science from Creighton University in 2005. He is currently an Instructor of Surgery and an Assistant Professor of Family Medicine for the Mayo Clinic College of Medicine.
