Modelling mutational signatures of environmental carcinogens in cultured human cells

Whole genome sequencing (WGS) of human tumors has revealed distinct patterns of mutation that hint at the causative origins of cancer. The Catalogue of Somatic Mutations in Cancer (COSMIC) is a global resource for information on somatic mutations in human cancer and currently lists 30 distinct mutational signatures. Some signatures are correlated with known environmental exposures, but the causative origins of many signatures remain unknown. We have developed an experimental approach using human induced pluripotent stem (iPS) cells to define mutational signatures of environmental carcinogens by WGS. Treatment conditions (e.g. concentration) for WGS were optimized by assessing cytotoxicity, DNA damage response signaling and the formation of premutagenic DNA adducts. After WGS, a ubiquitous background mutational signature was extracted in all clones showing similarities with COSMIC Signature 18 which has been reported in other cultured human cells. Specific signatures were identified in human iPS cells, following exposure to benzo[a]pyrene (BaP), simulated sunlight aristolochic acid I (AAI) and aflatoxin B1 (AFB1), revealing characteristic mutation pattern for each carcinogen that were highly similar to COSMIC signatures of mutations found in tumors of individuals who were exposed to the agent of interest: predominantly G to T mutations for BaP were linked to COSMIC Signature 4; C to T for simulated sunlight was linked to COSMIC Signature 7; A to T for AAI was linked to COSMIC Signature 22; and G to T for AFB1 was linked to COSMIC Signature 24. Thus, human cell-based systems and WGS can be used to study the genome as a record of environmental exposure.

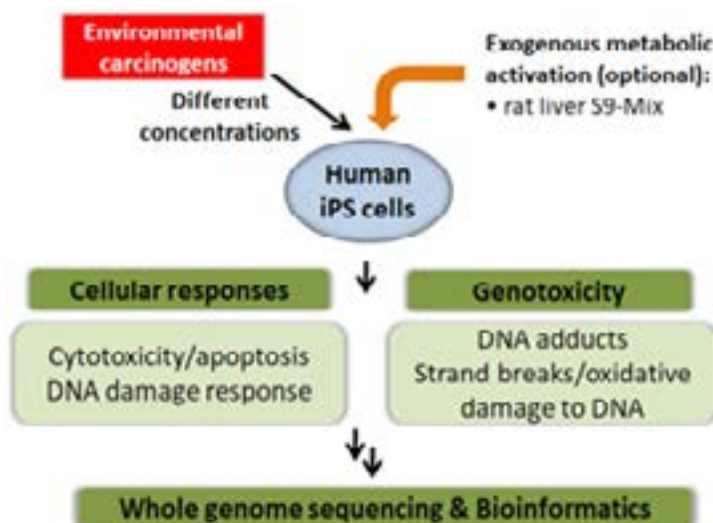

Figure 1: Experimental design for modelling the mutational signatures of DNA damaging agents in human induced pluripotent stem (iPS) cells by whole genome sequencing.

Biography

Volker M Arlt has an international profile of research in Environmental Carcinogenesis and Toxicology evidenced by over 180 articles published in high-ranked international journals within the field of research. His expertise is firmly rooted in Molecular Carcinogenesis as well as Genetic and Environmental Toxicology. He is Senior Lecturer in Environmental and Genetic Toxicology at King's College London and based at the Department of Analytical, Environmental and Forensic Sciences within the School of Population Health & Environmental Sciences. He also belongs to the MRC-PHE Centre for Environmental & Health. He is a European Registered Toxicologist.
