

JOINT EVENT

5<sup>th</sup> World Conference on **Climate Change**

&amp;

16<sup>th</sup> Annual Meeting onOctober 04-06, 2018  
London, UK**Environmental Toxicology and Biological Systems****Effects of aluminium salts and cyclic volatile methylsiloxanes on DNA damage and DNA repair in immortalized non-transformed human breast epithelial cells**Abdullah Mohammed O Farasani<sup>1,2</sup> and Darbre P D<sup>2</sup><sup>1</sup>Jazan University, Saudi Arabia<sup>2</sup>University of Reading, UK

Dermal absorption of components of underarm cosmetics may be a contributory factor in breast cancer development. Aluminium (Al) salts are added as the active antiperspirant agent, and cyclic volatile methylsiloxanes (cVMS) are used for purposes of conditioning and spreading. Al has been measured in human breast tissue, breast cyst fluid, nipple aspirate fluid and milk: Al levels in breast tissue have been recently reported to be a risk factor for breast cancer in young women. cVMS have been measured in human milk. The objectives of this study were to investigate any genotoxic effects of exposure to the antiperspirant salts Al chloride and Al chlorohydrate, and to the cVMS hexamethylcyclotrisiloxane (D3), octamethylcyclotetrasiloxane (D4) and decamethylcyclopentasiloxane (D5) in immortalized non-transformed human breast epithelial cells. All these compounds enabled a dose-dependent growth of the non-transformed cells in suspension culture, which is an established marker of transformation. DNA damage was demonstrated using a comet assay. Long term ( $\geq 20$  weeks) exposure to these compounds also resulted in loss of expression (mRNA and protein) of the breast cancer susceptibility gene BRCA1 which is a key gene in the repair of DNA in breast cells. Alterations to expression of other DNA repair genes at an mRNA level will be presented. If these compounds can both damage DNA and compromise DNA repair systems, then there is the potential for breast carcinogenesis.

**Biography**

Abdullah Mohammed O Farasani received his PhD from Reading University, UK in 2016 for his work on genotoxicity of cosmetic chemicals in human breast epithelial cells. He is currently working as the head of Genetic Unit in the MLT Department at Jazan University, Saudi Arabia.
