Case Report on P-Value in Medical Research

For rejecting the Null Hypothesis H0, the level of Significance $P<0.05$ is uniformly accepted as the threshold value in medical science research. After 90s by implication of computers and software in statistical analysis the reporting style of P value is changed in all the journals.

If a P value $2.876*E-13$, reporting this figure without any rounding-off may not be appreciated, [1] by all the Medical researchers. Some software shows the P value as 0.000 (If you click [2] it will show the original P value) and there is no standard format for reporting the P value as the level of significance. There is lot of discussions [3,4] on how to report P value. If this P value, reported as $2.876*E-13$ (not a simple format) or 0.000 is debated, and some statistician are in the opinion that instead of writing P as 0.000 it should be shown [5] as $P<0.001$ (but strictly speaking $P<0.0000000000002875$). Assuming that most of the journals allow P value for three decimals, now the big question is $P=0.000$ or $P<.001$ when the original value is 0.0000000000002876.

It is rational to consider that P can be reported as $P=0.000$ with logic that the difference between any two equal valued integers are written as simply zero/the difference between 1.897432 and 1.897432 is too written as zero and not as 0.000000. From the following table some phrases have special meaning in statistics.

Terms

Error

r=0.587 and r=-0.886

Bias

In general

Mistake

0.587 is greater

Prejudice or unfair

Statistical Meaning

Residual SS or O-E value

-0.886 is greater

Difference between Parameter and the Estimate (Many type of Bias)

And so on.

Conclusion

Hence by induction, it is proposed that P can be reported as 0.000 with the statistical meaning that the 'probability values is zero at least for first three decimals', and not to consider this 0.000 as just mathematical zero.

Terms

P=0.000

In general

0 (Zero)

Statistical Meaning

Probability values is zero at least for first three decimals,

Unless a special situation warranted and if data is analysed using computer then P can be reported for three decimals with equal sign.
