Here you can find about Bone Marrow Research, their increasing role in the diagnosis, characterization, therapy of various bone marrow related diseases. The journal provides an open access platform to publish latest advancements related to all aspects of bone marrow.

Journal of Bone Marrow Research is an Open Access scientific journal which is peer-reviewed. It publishes the most exciting researches with respect to the field of Bone Marrow research and their applications. This is freely available online journal which will be soon available as a print.
Dear Editor,

A Bone Marrow Biopsy (BMB), though not essential for diagnosing Chronic Myeloid Leukemia (CML) in chronic phase, remains a first-line investigation in the work-up, prognostication and follow-up of this disorder. It demonstrates histological and topographic features, proliferation patterns, detects CML metamorphosis and fibrosis and is indispensable in the investigation of unexplained cytopenias during therapy.

**Histology of CML**

The hypercellular marrow of CML shows panmyelosis and a virtual absence of adipocytes. There is granulocytic and/or megakaryocytic proliferation, eosinophilia and basophilia, occasionally with pseudo-Gaucher / sea-blue histiocytes and fibrosis. Past studies divided CML into two histological subtypes: a commoner granulocytic variant (~66%) showing unilinar granulopoietic hyperplasia, and a bilinear megakaryocytic type (~33%) additionally showing megakaryocytic hyperplasia, altered topology and pleomorphism with ineffective diminished erythropoiesis and grade 2-4 reticulin [1]. The clinical significance of this distinction (apart from the higher grade of fibrosis encountered in the megakaryocytic-type) remains controversial (Figure 1).

**Fibrosis in CML**

Manifest myelofibrosis is an adverse morphological factor associated with larger spleens, increased circulating blast percentages, lower hemoglobin levels and additional karyotypic abnormalities. Grading of collagen density, whether semi-quantitative or by computerized morphometry; reveals that even slight increase in reticulin (compatible with doubled normal values) is associated with significantly worsened prognosis [2]. Thiele et al. recommended that myelofibrosis should be included in any staging system in CML relating to survival [3].

**Histological changes in therapy**

Imatinib mesylate therapy significantly decreases cellularity, neutrophil granulopoiesis, abnormal micromegakaryocytes, microvesSEL density and cell proliferation indices with regression of myelofibrosis. There is an increase in erythroid precursors and reactive lymphoid nodules with enhanced apoptosis. Myeloblasts, CD34+ cells and immature myelomonocytic cells also decrease in patients who go into complete or partial remission [4]. Imatinib-associated marrow aplasia has been described. Interferon-alpha induces apoptosis, resulting in reduced cellularity, expansion of normal erythropoiesis with increased iron-laden histiocytes and reticulum cells. Busulfan promotes myelofibrosis while hydroxyurea prevents it in a significant number of patients. In a study on 363 BMBS taken sequentially before and after allogeneic bone marrow transplantation, there was a significant correlation of marrow fibrosis, CD61+ cells and peripheral blood platelet counts with delayed haemopoietic reconstitution and leukemic relapse [5].

**Ancillary studies on the BMB**

Apart from assessing cellularity and fiber content, the BMB is also suitable for immunohistochemistry (angiogenesis, apoptosis, proliferation indices) and morphometric studies as well as Fluorescent In-Situ Hybridization (FISH). Application of FISH to paraffin sections for demonstrating bcr/abl in intact cells, though not recommended for diagnosis, has been used as an adjunct to cytogenetic studies and to demonstrate the common stem cell origin of the CML clone. FISH for bcr/abl on BMBS was also found to be useful to monitor therapeutic efficacy of Imatinib [6].

**Conclusion**

In conclusion, the BMB remains a valuable investigation in CML, both for the wealth of prognostic information conveyed as well as its usefulness in investigating scientific queries.
