Case of Caudal Duplication Twins
Amin El-Gohary M*

Professor of Pediatric surgery, Burjeel hospital, Abu Dhabi, UAE

A case of caudal duplication, born in Somalia on October 1997 and were referred to Mafraq Hospital for surgical management at the age of 13 months (Figure 1). The Computed tomography (CT) and magnetic Resonance imaging (MRI) revealed to well-developed lower limbs with a significant blood supply arising from the internal iliac vessels on both sides. The extra limbs were removed after ligating the feeding vessel. Histopathology reported normal tissues with no teratoma.
