Abstract

Carbon dioxide is a major cause of natural calamities and changes in climatic conditions. Of all the sources of emission, the amount of carbon dioxide from automobiles is approximately 65%, which is more than any other sources of emissions. Raise in carbon dioxide content in atmosphere is causing global warming which is evolved from greenhouse gases. To reduce the emission and control of carbon dioxide percentage in atmosphere form automobiles, theoretical and practical methods of adsorption of carbon dioxide using activated charcoal (carbon) in diesel operated engines is conducted. Charcoal is one of the best adsorption material due to its high porous valve and capture capacity, when reacted with other reagents in order of activation, it increases its adsorption capacity than that of regular charcoal. In this project the activation of charcoal is steam activation. The amount of carbon dioxide exhausted from diesel engine in ideal condition and after the reactor chamber is added to the exhaust system the content of carbon dioxide is controlled up to 9.266%.

Keywords: Control of carbon dioxide; Adsorption; Activated charcoal; Steam activation; Emission; Smoke test

Introduction

Carbon dioxide is the one of the gases in atmosphere bearing percentage of 0.04, it plays an important role in maintaining optimal condition of earth by enriching photosynthesis in plants and other benefits, but it has also become a major issue in the recent decade due to its increase in percentage leading to increasing the global temperature, which causes melting down of glaziers and increasing water levels, heavy changes in temperature.

There are two major sources of carbon dioxide, natural and human. Natural sources are ocean-atmosphere exchange, plant and animal respiration, soil respiration and decomposition and finally volcanic eruption. Human sources are fossil fuel usage, land use changes and industrial process. Carbon dioxide is the primary greenhouse gas emitted through human activates, the main activate that emits carbon dioxide is the combustion of fossil fuels (coal, natural gas and oil) for energy and transportation, although sustain industry process and land use changes also emit carbon dioxide. The main sources of carbon are diode, car, electric, transportation and industry. Carbon dioxide is constantly being exchange among the atmosphere, ocean and land surface as it both produce and adsorb many microorganism, plants and animals.

However, emissions and removal of carbon dioxide by this natural process tend to balance. Since the industrial revolution began around 1750, human activity has contributed substantially to the climatic change by adding carbon dioxide and other heat trapping gases to atmosphere.

Rajadurai et al. [1] the efforts of humans to gain more energy output is dearly costing the entire planet in phase of carbon dioxide, emission of this gas can be controlled by implementing some major changes at the source of emissions. An inventive trend of using a chamber at the tailpipe of an exhaust system, which traps and stores the carbon dioxide from the exhaust gases. Modified charcoal made of coconut trunk and stem is used to trap and store carbon dioxide from the exhaust gases. The theory of storage and using of carbon dioxide can be helpful in many other industrial which uses carbon dioxide for many other purposes [2-4].

Valentinas Mukunaitis et al. [5] the total content of carbon dioxide emissions from diesel operated engine is lesser than that of petrol engine, in numerical terms its 27% and 17% petrol and diesel respectively. When the engine displacement is high then the consumption of fuel is also high.

Catalytic convertor is another major part which plays an important role in the exhaust system, the process of oxidation and reduction of on dangerous gases emitted from the exhaust gases, there are also major break through which helps in improving the performance of catalytic convertor without any changes their properties, like back pressure and flow of gases [6,7].

In order to reduce carbon dioxide from the automobile exhaust emission we used granular activated charcoal which has diffusion of adsorbate is thus an important factor this carbons are suitable of adsorption of gases and vapours, because they diffuse rapidly (Table 1). Granular carbon are used for water treatment, deodorization and separation of components of flow system and also used in rapid mix basins (Figure 1).

Gas analyser

Gas analyser is a device which is used to measure the content of various gases present in a system or surroundings (Table 2). Here it is...
The ingredients needed to prepare the coconut shell catalyst are as follows:

- Charcoal: 1400 gm
- Zinc chloride: 56 gm
- 1400 ml of distilled water was taken in a beaker.
- 56 gram of ZnCl$_2$ was added in the beaker.
- Both the ZnCl$_2$ and distilled water were mixed to form a solution.
- 950 gram of coconut charcoal was added inside the solution beaker.
- The mixture was tried continuously to have a better coating on the coconut charcoal.
- The coated sample was heated treated in furnace for 14 hours at 85°C.

**Design Concept**

**Design calculation**

The catalytic convertor is designed with the following three objectives:-

1. Used in measuring the content of hydrocarbons, carbon monoxides, carbon dioxide and nitrogen and lambda present in the exhaust gases of and engine [4].

The technical specification of a gas analyser are as follows (Figure 2).

**Activated charcoal**

Activated carbon is a type of carbon that is activated and carefully controlled oxidation process to improve pours structure of carbon. The improper structure of carbons in a high degree of pourcity and over a board range of pour sizes, vizable cracks and minure to gaps and voids of molcular dimentions the determined structure of carbon will gives it a very large surface area which undergo the carbon to adsorbe a huge amount of carbons molucules (Table 3).

Activated carbon has hieght of voloumn to adsorbing pourcity of any kind of material that is aviliable in mankind (Figure 3).
• Simple construction (No complicated construction).
• To obtain a greater Surface area.
• To reduce the back pressure.
• The network output per cycle from the engine is dependent on the pumping work consumed, which is directly proportional to the backpressure. To minimize the pumping work, backpressure must be as low as possible. The backpressure is directly proportional to the catalytic converter design. The catalytic substrate and shape of the inlet cone do not contribute to the backpressure [6,7].
• The cylindrical shape was considered due to ease of fabrication, minimum assembly time, rigidity and easier maintenance.

Space velocity
The time necessary to process one reactor volume of gases is as follows:
Calculation for Determination of Diameter and Length:

\[ \text{Space velocity} = \frac{\text{Volume of flow rate}}{\text{Catalysts volume}} \]
Assuming Space Velocity = 16000 m/hr.

Volume flow rate = Swept volume \times Number of Intake stroke per hour

\[ \text{Volume flow rate} = \frac{\pi}{4} \times (82.5)^2 \times (92.8) \times \frac{1500}{2} \times 60 = 44.427 \, m^3 \]

\[ \text{Catalysts volume} = \frac{\text{Volume flow rate}}{\text{space velocity}} = \frac{44.78}{16000} \]

Volume of Catalyst = 0.0027 m³.

Shell dimension
The Shell is the cylindrical part between the inlet and outlet cones. Activated charcoal will be placed inside this shell.

\[ V_{\text{catalyst}} = \frac{\pi}{4} \times D^2 \times Lz \]

Where D = Diameter of the catalyst
L = Length of the Catalyst
L = 3D (Assume)
0.0027 = 0.785 \times D^3 \times 3
D = 0.103 m
L = 3D
L = 3 \times 108
L = 309 mm

Experimental layout
This flow chart explains about experiential work that deals with the adsorption of carbon dioxide. The diesel operated engine’s exhaust is connected to the after-treatment system, which leads to muffler which reduces the turbulence or the flow in gases and passes through the intermediate valve [8-10]. Which is connected to two way valve, where the connection leads to atmosphere and the other leads to a experiential setup connected to flow meter, in the first connection, when there is over flow of gases, open the two way valve to the atmosphere till we get the constant flow. If a constant flow is generated then we close the secondary valve and open primary valve which is connected to flow meter. Flow meter now shows the mass flow of gases from the exhaust towards the reactor chamber (Figure 4).

Then further a two way valve is fixed to collect the sample gas and measure the content of gases present in the flow, this flow of gas is passed through the reactor chamber where the reaction (adsorption) is taken place and then a second sample is taken to measure the content of gases absorbed in the reaction chamber. Then the gases are passed out the atmosphere [11,12].

Design Validation
The validation of design is done using catia and CFD analysis, this involves various stages of procedures as follows, It is necessary to test...
Pressure drop and flow uniformity index in CFD analysis (Figures 5 and 6).

**CFD analysis**

Below Figure 7 shows the pressure drop obtained in both cases:
Case A – Charcoal Chamber, (Flow through top to bottom).
Case B – Charcoal Chamber, (Flow through only cone).

Below, Figure 8 shows the pressure drop between two cases. For Case A, the observed pressure drop is 75.045 mbar; for Case B, the observed pressure drop is 65.538 mbar. The calculated pressure drop is within target criteria. Hence, it will not affect engine performance (Table 4).

**Uniformity index**

Below, Figures 9 and 10 shows the uniformity plot of Activated Charcoal chamber, respectively. The reactor chambers’ uniformity is 0.889; however, the target is >0.90 for initial confirmation of the analysis. To reach the uniformity target, inlet and outlet cone optimization is done.

**Layout fabrication**

A wire mesh is rolled in the cylindrical shape with the same or lesser dimensions of the reaction chamber. With both closed ends, as shown in the Figure 11 below. Which is filled with activated charcoal in it [13].

Then that wire mesh is imposed into the reaction chamber where the adsorption process takes place, the below Figure 12 shows the reactor chamber with activated charcoal wire mesh [14].

This is fixed to the setup, where the experiment is carried out, the experimental layout is shown below in step by step procedure (Figure 13).

**Experimental Procedure**

The test on CO₂ reactor chamber is conducted on Volkswagen Jetta TDI 2.01 with automatic transmission. AVG gas analyser is used to measure the content of gases and their percentage present in the exhaust (Figure 14).

**Layout assembly and procedure of testing**

- Initially the reactor chamber is prepared by placing wire mesh with activated charcoal in it and fixed to the fabricated layout.
- Flow meter is now connected to the setup and placed vertically [15].
- Now the tailpipe of the vehicle is connected to the flow meter using two way valves in the procedure, which is used to regulate the flow of the exhaust in to the setup or to the atmosphere. There are two way valves placed in front of the reactor chamber and next to the chamber which are used to collect the sample gases, by which the content of gases can be determined.

**Results and Discussions**

After performing the testing on the setup according to variation
on rpm, sample gases are collected to test the percentage of various gases present in it, before and after the testing is performed [16,17]. The results are as follows (Table 5).

The overall reduction of carbon dioxide by this experiment is 9.266% from the exhaust gases. There is also reduction in other emissions in the exhaust gases like carbon monoxides and nitrogen oxides (Table 6).

### Conclusion

In this experiment we have successfully controlled emission of carbon dioxide from the diesel operated engines, which is about 9.266% of the overall emission from a vehicle. Through this other gases has also been controlled like hydro carbon, nitrogen, carbon monoxide and particulate matter.

OMICS International: Publication Benefits & Features

Unique features:
- Increased global visibility of articles through worldwide distribution and indexing
- Showcasing recent research output in a timely and updated manner
- Special issues on the current trends of scientific research

Special features:
- 700+ Open Access Journals
- 50,000+ editorial team
- Rapid review process
- Quality and quick editorial, review and publication processing
- Indexing at major indexing services
- Sharing Options: Social Networking Enabled
- Authors, Reviewers and Editors rewarded with online Scientific Credits
- Better discount for your subsequent articles
