Diagonally Implicit Super Class of Block Backward Differentiation Formula with Off - Step Points for Solving Stiff Initial Value Problems

Babangida B* and Musa H
Department of Mathematics and Computer Sciences, Umaru Musa Yar’adua University, Katsina, Nigeria

Abstract

A new formula called 2-point diagonally implicit super class of BBDF with two off-step points (2ODISBBDF) for solving stiff IVPs is formulated. The method approximates two solutions with two off-step points simultaneously at each iteration. By varying a parameter \( \rho \in (-1,1) \) in the formula, different sets of formulae can be generated. A specific choice of \( \rho = \frac{3}{4} \) is made and it was shown that the method is both zero and A-stable. A comparison between the new method and the existing 2-point block backward differentiation formula with off-step points (2OBBDF) is made. The results show that the new method outperformed existing 2OBBDF method in terms of accuracy.

Keywords: Off-step; Diagonally implicit super class of block backward differentiation formula; Stiff IVPs; Implicit block method; A-stability

Introduction

Consider a system of first order stiff initial value problems (IVPs) of the form:

\[
y_i’(x_i) = f_i(x_i, y_i), \quad i = 1, 2, \ldots, n.
\]

With \( \eta(x) = \eta_i \) in the interval \( a \leq x \leq b \) where \( \eta = (y_1, y_2, \ldots, y_n) \) and \( \eta = (\eta_1, \eta_2, \ldots, \eta_n) \).

System (1) is said to be stiff if it contains widely varying time scales, i.e., some components of the solution decay much more rapidly than others. Most realistic stiff systems do not have analytical solutions so that a numerical procedure must be used. Stiff ODEs occur in many fields of engineering and physical sciences such as electrical circuits, vibrations, chemical reactions, kinetics etc.

Developing methods for solving stiff problems remains a challenge in modern numerical analysis. Curtiss and Hirschfelder [1] discover Backward Differentiation Formula (BDF). Since then most of the improvements in the class of linear multistep methods have been based on BDF because of its special properties. Ibrahim [2] introduced r-point block BDF (BBDF). Super class of block BDF, which is both zero and A-stable, was developed by Suleiman [3,4]. The method is derived from 2-point block BDF and outperformed both 2BBDF and IBDF in terms of accuracy.

In order to gain an efficient numerical approximation in terms of accuracy and computational time, a super class of diagonally implicit BBDF method can be considered. The study of diagonally implicit for multistep attracted some researchers such Ababneh [5], Alexander [6], Musa [7] and Zawawi [8]. Abasi [4] developed a 2-point Block BDF Method with off-step points for solving Stiff ODEs which differs from all the methods above because it calculates two solution values with off-step points simultaneously at each iteration. The motivation of this research is to develop a new method that would be called diagonally implicit superclass of BBDF with off-step points.

Derivation

In this work, two solution values, \( y_{n+1} \) and \( y_{n+2} \) with step size \( h \), and two off-step points \( y_{n-1} \) and \( y_{n+3} \) which are chosen at the points where the step size is halved, are formulated in a block simultaneously. The formulae are computed using two back values \( y_{n-1} \), \( y_{n+1} \) with step size \( h \). The formula is derived with the aid of this diagram below (Figure 1).

Definition 2.1: The 2-point diagonally implicit super class of block backward differentiation formula with off-step points is defined as:

\[
\sum_{j=0}^{1+k} \alpha_{j,i} y_{n+1-k-j} = h \beta_i \left( f_{n+k} - \rho f_{n+k-2} \right), \quad k = i, i+1 \text{ represents the first point, } k = i+2 \text{ represents the second point, } k = \frac{i+3}{2} \text{ represents the third point and } k = \frac{i+4}{2} \text{ represents the fourth point.}
\]

The formula (2) is derived from Taylor’s series expansion as follows:

Definition 2.2: Linear operator \( L_i \) associated with first, second, third and fourth point DI2SBBDF with off-step point is defined by:

\[
L_i y_{n+1} = \frac{h}{2} \left( f_{n+1} - \rho f_{n-1} \right), \quad i = 1, 2, 3, 4
\]

Figure 1: Points involved in 2-point super class BBDF with off-step points method.
\[ L \left[ y(x_i), h \right] : a_0 y_{i+1} + a_1 y_i + a_2 y_{i-1} - h \beta_{i+1} = 0, \quad k = i = \frac{1}{2} \]

\[ L \left[ y(x_i), h \right] : a_{0i} y_{i+1} + a_{1i} y_i + a_{2i} y_{i-1} + a_{3i} y_{i+2} - h \beta_{i+1} = 0, \quad k = i = 1 \]

\[ a_{2i} y_{i+1} - h \beta_{i+1} \left( f_{i+1} - \rho f_{i+3} \right) = 0, \quad k = i = 2 \]

**First point:** To derive the first point \( y_{i+1} \), let \( k = i = \frac{1}{2} \) and define the operator as

\[ a_{0i} y_{i+1} + a_{1i} y_i + a_{2i} y_{i-1} - h \beta_{i+1} \left( f_{i+1} - \rho f_{i+3} \right) = 0. \]

Expanding (7) as Taylor series about \( x_n \) and collecting like terms gives

\[ C_1 y(x_n) + C_2 y(x_n) + C_3 y(x_n) + \ldots \]

(8)

Where,

\[ C_1 = a_0 + a_1 + a_2 = 0, \]

\[ C_2 = a_0 + a_1 + a_2 = 0, \]

\[ C_3 = a_0 + a_1 + a_2 = 0. \]

The coefficient of \( y_{i+1}, y_i, y_{i-1} \) is normalized to 1. Solving the simultaneously equation (9) for the values of \( a_{1i} \)'s and \( \beta_{i+1} \)'s gives the formula for \( y_{i+1} \) as

\[ y_{i+1} = \frac{1}{4} \rho \frac{3}{4} y_i + \frac{3}{4} \rho - \frac{3}{4} y_{i-1} + \frac{3}{4} y_{i+2} - \frac{3}{4} \beta_{i+1} \rho h f, - \frac{3}{4} \beta_{i+1} \rho f h \]

(10)

Similar procedure is applied as in the derivation of first point to obtain the second, third and fourth points as:

\[ y_{i+2} = \frac{1}{3} \left( \frac{3}{4} y_i + \frac{3}{4} y_{i-1} + \frac{3}{4} y_{i+2} \right) \]

\[ y_{i+3} = \frac{1}{3} \left( \frac{3}{4} y_{i-1} + \frac{3}{4} y_{i+1} + \frac{3}{4} y_{i+3} \right) \]

(11)

(12)

(13)

For absolute stability of the method, \( \rho \) is chosen to be in the interval (-1,1) as in Suleiman [3]. By choosing \( \rho = \frac{3}{4} \) in equation (10), (11), (12) and (13) to obtain the 2-point diagonally implicit super class of BBDF with off-step points as follows:

\[ y_{i+1} = \frac{1}{11} y_{i-1} + \frac{5}{47} y_i + \frac{1}{88} y_{i+1} - \frac{12}{47} h f_{i+1} + \frac{16}{47} h f_{i+2} \]

\[ y_{i+2} = \frac{3}{88} y_{i-1} + \frac{13}{22} y_i + \frac{21}{11} y_{i+1} + \frac{207}{88} y_{i+2} - \frac{9}{44} h f_{i+2} + \frac{3}{11} h f_{i+3} \]

(14)

In matrix form, equation (14) can be written as

\[ \begin{pmatrix} 1 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \end{pmatrix} \begin{pmatrix} y_{i+1} \\ y_{i+2} \\ y_{i+3} \\ y_{i+4} \end{pmatrix} = \begin{pmatrix} \alpha & -\frac{3}{2} & \frac{3}{2} & 0 \\ \frac{1}{2} & \alpha & -\frac{3}{2} & \frac{3}{2} \\ 0 & \frac{1}{2} & \alpha & -\frac{3}{2} \\ 0 & 0 & \alpha & -\frac{3}{2} \end{pmatrix} \begin{pmatrix} y_{i-1} \\ y_i \\ y_{i+1} \\ y_{i+2} \end{pmatrix} \]

(15)

**Definition 2.3:** Method (15) is diagonally implicit if the matrix in its left hand side is an upper triangular.

**Order of the Method**

This section derives the order of the method corresponding to the equations in (14). It can be written in the following form:

\[ y_{i+1} = \frac{1}{2} y_{i-1} - \frac{7}{20} y_i + \frac{27}{20} y_{i+1} - \frac{9}{20} h f_{i+1} + \frac{3}{5} h f_{i+2} \]

\[ y_{i+2} = \frac{1}{88} y_{i-1} + \frac{13}{22} y_i + \frac{21}{11} y_{i+1} + \frac{207}{88} y_{i+2} - \frac{9}{44} h f_{i+2} + \frac{3}{11} h f_{i+3} \]

(16)

Equation (16) can be written as in matrix form as:

\[ \begin{pmatrix} 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \end{pmatrix} \begin{pmatrix} y_{i+1} \\ y_{i+2} \\ y_{i+3} \\ y_{i+4} \end{pmatrix} = \begin{pmatrix} 1 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \end{pmatrix} \begin{pmatrix} y_{i-1} \\ y_i \\ y_{i+1} \\ y_{i+2} \end{pmatrix} \]

(17)
Let $D_1 = \begin{pmatrix} 27/20 & 0 \\ 0 & 280/141 \\ 0 & 0 \\ 0 & 0 \end{pmatrix}, D_2 = \begin{pmatrix} 50/47 & -13/21 \\ -13/21 & 110/141 \\ 9/47 & 0 \\ 0 & 0 \end{pmatrix}, D_3 = \begin{pmatrix} 207/88 & -316/201 \\ -316/201 & 189/67 \\ 0 & 0 \\ 0 & 0 \end{pmatrix}$.

Definition 3.1: The order of the block method (14) and its associated linear operator $L$ given by:

$$L\left[ y(x); h \right] = \sum_{j=1}^{3} D_j \left( x + j \frac{h}{2} \right) - h G_j y^{'} \left( x + j \frac{h}{2} \right),$$

Expanding the function $y \left( x + j \frac{h}{2} \right)$ and its derivative $y^{'} \left( x + j \frac{h}{2} \right)$ as Taylor series around $x$ gives

$$y \left( x + j \frac{h}{2} \right) = y(x) + j \frac{h}{2} y^{'}(x) + \left( \frac{j^2}{2!} \right) y^{''}(x) + \cdots$$

$$y^{'} \left( x + j \frac{h}{2} \right) = y^{'}(x) + j \frac{h}{2} y^{''}(x) + \left( \frac{j^2}{2!} \right) y^{'''}(x) + \cdots$$

Substituting (19) and (20) into (18) represents

$$L\left[ y(x); h \right] = \sum_{j=1}^{3} D_j \left[ y(x) + j \frac{h}{2} y^{'}(x) + \left( \frac{j^2}{2!} \right) y^{''}(x) + \cdots \right] - h \sum_{j=1}^{3} G_j \left[ y(x) + j \frac{h}{2} y^{'}(x) + \left( \frac{j^2}{2!} \right) y^{''}(x) + \cdots \right]$$

$$= \sum_{j=1}^{3} D_j \left[ y(x) + j \frac{h}{2} y^{'}(x) + \left( \frac{j^2}{2!} \right) y^{''}(x) + \cdots \right] - 2 \sum_{j=1}^{3} G_j \left[ y(x) + j \frac{h}{2} y^{'}(x) + \left( \frac{j^2}{2!} \right) y^{''}(x) + \cdots \right]$$

$$+ \frac{1}{8} \sum_{j=0}^{3} \left[ 1 \frac{1}{21} f^{'} \left( x + \frac{h}{2} \right) \right] h^{3} y^{'''}(x) + \cdots$$

The difference operator (21) and the associated method (14) is considered of order $p$ if $E_0 = E_1 = \ldots = E_p = 0$ and $E_{p+1} \neq 0$.

In this case

$$E_0 = \sum_{j=0}^{3} D_j = 0 \cdot (22)$$

$$E_1 = \sum_{j=0}^{3} \left( jD_j - 2G_j \right) = 0 \cdot (23)$$

Therefore, the method (14) is of order 2, with error constant

$$E_1 = \begin{pmatrix} 9/10 \\ 0 \\ 0 \\ 0 \end{pmatrix} \cdot$$

Stability Analysis of SBBDF with Off-Step Point

The stability properties of method (14) are discussed here. We begin by defining zero and A-stability taken from Suleiman [3].

Definition 4.1: A LMM is said to be zero stable if no root of the first characteristics polynomial has modulus greater than one and that any root with modulus one is simple.

Definition 4.2: A LMM is said to be A-stable if its stability region covers the entire negative half-plane.

The method (14) can be rewritten in matrix form as follows:

$$\begin{pmatrix} 1 & 0 & 0 & 0 \\ 280/141 & 1 & 0 & 0 \\ 21 & -207 & 1 & 0 \\ 316/189 & -392/67 & 1 & 1 \end{pmatrix} \begin{pmatrix} y_{n+1} \\ y_{n+2} \\ y_{n+3} \\ y_{n+4} \end{pmatrix} = \begin{pmatrix} 0 \\ -7/20 \\ 11/141 \\ -3/88 \end{pmatrix} \begin{pmatrix} y_n^* \\ y_{n+1}^* \\ y_{n+2}^* \\ y_{n+3}^* \end{pmatrix} + \begin{pmatrix} 9/20 \\ 12/47 \\ 1005/67 \end{pmatrix} \begin{pmatrix} f_{n+1} \\ f_{n+2} \\ f_{n+3} \end{pmatrix} \cdot$$

Definition 4.3: Let $Y_n$ and $F_n$ be vectors defined by

$$Y_m = [y_n^*, y_{n+1}^*, \ldots, y_{n+m-1}^*]^T, \quad F_m = [f_n, f_{n+1}, \ldots, f_{n+m-1}]^T$$

(See Suleiman [3]).

Method (14) can be written in matrix form as follows:

$$A_n Y_n = A_{n-1} Y_{n-1} + h (B_n F_{n-1} + B_n F_n).$$

Where $A_n = \begin{pmatrix} 1 & 0 & 0 & 0 \\ 280/141 & 1 & 0 & 0 \\ 21 & -207 & 1 & 0 \\ 316/189 & -392/67 & 1 \end{pmatrix}, A_{n-1} = \begin{pmatrix} 0 \\ 7/20 \\ 11/141 \\ -3/88 \end{pmatrix} \begin{pmatrix} 2 & 2 & 2 & 2 \end{pmatrix} \cdot$$

J Appl Comput Math, an open access journal

ISSN: 2168-9679

Volume 5 • Issue 5 • 1000324
gives.                   (31)

\[ \begin{pmatrix} 0 & 0 & 0 & 9 \cdot \frac{20}{18425} \\ 0 & 0 & 0 & -12 \cdot \frac{47}{18425} \\ 0 & 0 & 0 & 3 \cdot \frac{11}{18425} \\ 0 & 0 & 0 & -12 \cdot \frac{67}{18425} \end{pmatrix} \]

Substituting scalar test equation \( y' = \lambda y (\lambda < 0, \lambda \text{ complex}) \) into (27) and using \( \lambda h = \bar{h} \) gives

\[ A_Y = A_Y^{\text{rec}} + \bar{h} \left( B_Y Y_{m+1} + B_Y Y_{m} \right). \] (28)

The stability polynomial of (14) is given by

\[ \det(A_{-} - \bar{h} B) \gamma - (A_{+} + \bar{h} B) = 0. \] (29)

i.e.,

\[ A_{i} = \begin{pmatrix} 8283 \cdot 10^{-5} & 4534 \cdot 10^{-6} & -729 \cdot 10^{-6} & 21472 \cdot 10^{-5} \\ -10734 \cdot 10^{-6} & 8470 \cdot 10^{-6} & -12997 \cdot 10^{-6} & 26704 \cdot 10^{-5} \\ -19734 \cdot 10^{-6} & 13740 \cdot 10^{-6} & -21076 \cdot 10^{-6} & 26704 \cdot 10^{-5} \end{pmatrix}, \] (30)

For zero stability, we set \( \bar{h} = 0 \) in (30) to obtain:

\[ t^4 - 24874 \cdot 10^{-5} t^3 + 6449 \cdot 10^{-6} t^2 = 0. \] (31)

Solving equation (31) for \( t \) gives the following roots:

\[ t = 0, t = 0, t = 0.350014 \text{ and } t = 1. \] (32)

From the definition 4.1, method (14) is zero-stable. The stability region of method (14) is determined by substituting \( t = e^{\theta} \) and the graph is shown below (Figure 2):

From the definition 4.2, method (14) is A-stable.

**Implementation of the Method**

Newton’s iteration is used in implementing the method. The procedure is described as follows. We begin by defining the error.

**Definition 5.1**

Let \( y_i \) and \( y_{i+1}(x_i) \) be the approximate solution of (1)

Then the absolute error is given by:

\[ \text{error} = |y_i - y_{i+1}(x_i)|. \] (33)

The maximum error is defined by

\[ \text{MAXE} = \max_{i=1}^{N} \max_{j=1}^{N} \{\text{error}\}. \] (34)

Where, \( T \) is the total number of steps and \( N \) is the number of equations.

Define from (14)

\[ F_i = y_{i+1} + \frac{9}{20} h f_{i+1} - \frac{3}{5} h f_{i} + e_i, \]

\[ F_i = y_{i+1} + \frac{280}{141} y_{i+1} + \frac{12}{47} h f_{i+1} - \frac{16}{47} h f_{i} + e_i, \] (35)

\[ F_i = y_{i+1} - \frac{207}{88} y_{i+1} + \frac{9}{44} h f_{i+1} - \frac{3}{11} h f_{i} + e_i, \]

Where \( e_i = \frac{7}{20} y_{i-1} - \frac{27}{20} y_{i}, e_i = \frac{11}{141} y_{i-1} + \frac{50}{47} y_{i} - \frac{3}{8} y_{i-1} + \frac{13}{22} y_{i} \), and

\[ e_i = -\frac{19}{1005} y_{i-1} + \frac{29}{67} y_{i} \] are the back values.

Let \( y_{i+1}(x_i) = y_{i+1}(x_i) = y_{i+1}(x_i) \), denote the \( i \)th iterative values of \( y_{i+1}(x_i) \) and define

\[ e_{n+1}^{(i+1)} = y_{i+1}^{(i+1)} - y_{i+1}(x_i) = j = \frac{1}{2}, \frac{3}{2}, \frac{5}{2}. \] (36)

Newton’s iteration for the 2-point SBBDF with off-step point method takes the form:

\[ e_{n+1}^{(i+1)} = -F'(y_{i+1}) \left[ y_{i+1}(x_i) \right]^{(i+1)} - F'(y_{i+1}) \left[ y_{i+1}(x_i) \right]^{(i+1)} = \frac{1}{2}, \frac{3}{2}, \frac{5}{2}. \] (37)

This can be written as

\[ F'(y_{i+1}) e_{n+1}^{(i+1)} = -F'(y_{i+1}) \left[ y_{i+1}(x_i) \right]^{(i+1)} = \frac{1}{2}, \frac{3}{2}, \frac{5}{2}. \] (38)

and in matrix form, equation (38) is equivalent to

\[ \begin{pmatrix} 1 - \frac{3}{5} \frac{\partial y}{\partial x} \\ -280 \cdot 141 \frac{\partial y}{\partial x} + \frac{47}{11} \frac{\partial^2 y}{\partial x^2} + \frac{16}{47} \frac{\partial y}{\partial x} \\ 21 \frac{11}{11} \frac{\partial y}{\partial x} - \frac{207}{88} \frac{\partial y}{\partial x} + \frac{9}{44} \frac{\partial^2 y}{\partial x^2} - \frac{3}{11} \frac{\partial y}{\partial x} \\ 316 \frac{201}{201} \frac{\partial y}{\partial x} - \frac{189}{97} \frac{\partial y}{\partial x} - \frac{902}{135} \frac{\partial^2 y}{\partial x^2} + \frac{16}{47} \frac{\partial y}{\partial x} \end{pmatrix} \left( \begin{array}{c} e_{n+1}^{(i+1)} \\ \frac{\partial y}{\partial x} \\ \frac{\partial^2 y}{\partial x^2} \\ \frac{\partial y}{\partial x} \end{array} \right) = \left( \begin{array}{c} 0 \\ 0 \\ 0 \\ 0 \end{array} \right) \]
Tested Problems

To validate the efficiency of the methods developed, the following stiff IVPs are solved:

1. \( y_1' = -20y_1 - 19y_2, \quad y_1(0) = 2, \quad 0 \leq x \leq 20, \)
   \( y_2' = -19y_1 - 20y_2, \quad y_2(0) = 0. \)

   Exact solutions:
   \( y_1(x) = e^{-39x} + e^{-x} \)
   \( y_2(x) = e^{-39x} + e^{-x} \)

   Eigen values: -1 and -39

   Source: Musa [9]

2. \( y_1' = 198y_1 + 199y_2, \quad y_1(0) = 1, \quad 0 \leq x \leq 10, \)
   \( y_2' = -398y_1 - 399y_2, \quad y_2(0) = -1. \)

   Exact solution: \( y_1(x) = e^{-x} \)
   \( y_2(x) = e^{-x} \)

   Eigen values: -1 and -200

   Source: Ibrahim [2].

3. \( y' = 20y + 20\sin x + \cos x, \quad y(0) = 1, \quad 0 \leq x \leq 2, \)
   Exact Solution: \( y(x) = \sin x + e^{-20x} \)

   Source: Abasi [4]

4. \( y' = -100(y - x) + 1, \quad y(0) = 1, \quad 0 \leq x \leq 10, \)
   Exact Solution: \( y(x) = e^{-100x} + x \)

   Source: Abasi [4]

Numerical Results

The numerical results for the test problems given in section 6 are tabulated. The problems are solved with 2OBBDF and 2ODISBBDF methods. The number of step taken to complete integration and maximum error for the different methods is presented and compared in the tables below. In addition, the graph of \( \log_{10}(\text{MAXE}) \) against \( h \) for each problem is plotted (Figures 2-6) in order to give the visual
Figure 5: Graph of $\log_{10}(\text{MAXE})$ against $h$ for problem 3.

Figure 6: Graph of $\log_{10}(\text{MAXE})$ against $h$ for problem 4.

Table 1: Numerical results for problems 1, 2, 3 and 4.
impact on the performance of the method. The notations used in the tables are listed below:

The following abbreviations are used in the tables:

2ODISBBDF = 2-point super class BBDF with off-step points
2OBBDFF = 2-point block BDF method with off-step points of order 5

\( h \) = step size

NS = total number of steps

MAXE = maximum error

Time = computational time in seconds (Table 1).

To give the visual impact on the performance of the method, the graphs of Graph of \( \log_{10}(\text{MAXE}) \) against \( h \) for the problems tested are plotted. Given below are the graphs of the scaled maximum error arranged problem by problem.

From the table 1 above it can be seen that 2ODISBBDF method outperformed 2OBBDFF method in terms of accuracy. The graphs also show that the scaled errors for the 2ODISBBDF method are smaller when compared with that in 2OBBDFF method.

**Conclusion**

A new method of order 2 that is suitable for solving stiff initial value problems has been developed. The stability analysis has shown that the method is both zero and \( A \)-stable. Accuracy and the execution time of the derived method are compared with the existing 2-point block backward differentiation formula with off-step points (2OBBDFF). This comparison shows that the new method outperformed the existing 2OBBDFF method in terms of accuracy. The computation time for the new method is seen to be competitive. The graphs also show that the scaled errors for the 2ODISBBDF method are smaller when compared with that in 2OBBDFF method.
