Editorial

Dear Journal of Defence Management's readers.

I greet you after the relax time during your summer holiday. We all know that also this time was stigmatized with a lot of war activities in the whole world. It means that not only soldiers, politicians but also scientific workers have to be prepared to think of new technologies and methods to protect against their effects. The scope of the Journal of Defence Management presented in this issue is the biggest proof of this idea.

The first paper deals with problems related to nuclear facilities and nuclear weapons as a guarantee of peace. For people who are interested in questions of nuclear energy, nuclear weapons and toxic industrial radioactive this paper brings a lot of ideas for making good opinion to think of nuclear weapons from rather different side than it is usual. Next paper can be very interested for soldiers who play a very important role within a process of units and other military structure command and control. The paper named Applied game theory to improve strategic and tactical military decisions can motivate commanders to enhance their knowledge in typical military knowledge – command and control. This paper quite corresponds with the paper named Evolution of decision making processes in command

during irregular warfare operations. The author stress that traditional military processes have been ineffectual and short sighted in recent contemporary conflicts yet modern developments which begin to explore processes for enabling quick, flexible decision making are beginning to be incorporated into the command toolbox. His opinions are very interesting and I am convinced that a lot of readers should learn from this author's very comprehensive approach on this very complex theory and practice.

To be honest, I am really pride of authors who contribute to the Journal of Defence Management. Especially I would like to express my respect to authors who regularly send papers to this journal in order to enhance its scientific reputation. The quality of any journal mainly depends on regularity and quality. Only these aspects can ensure that the journal survives in the future and to win a competition among other journals and magazines. We have to know that military topics are not quite interesting for common readers. However, they have invaluable importance for military professionals who want to enhance military science and technologies on better level.

I wish all authors to have many new ideas for their scientific work, many good co operations with industrial base and other colleagues.
