Editorial

Phytochemicals, such as phenolic compounds are considered beneficial for human health since they decrease the risk of degenerative diseases by reducing oxidative stress and inhibiting biomolecular oxidation with free radical-scavenging activity [1].

Polyphenols are responsible for the antioxidative and radical scavenging activities of plant food [2]. Natural honeybee products are apicultural compounds which are composed of nutritionally valuable substances and contains considerable amounts of polyphenolic compounds, mainly flavonoids, which may act as potent antioxidant molecules [3].

Pollen is one of these natural antioxidant apicultural products. Honeybee pollens are the male generative cells gathered by honeybees from flower stamens and give plenty of phenolic compounds. Bee pollen is considered a health food with a wide range of therapeutic properties. Bee pollen is receiving special attention in the field of functional foods and medicines [3]. Composition of bee pollen can vary due to their botanical and geographic origin, contain carbohydrates, amino acids, proteins, lipids, vitamins, minerals, phenolic compounds, flavonoids, concentrations of phytosterols and are also rich in phytochemicals [1].

Bee-collected pollen, which is generally gathered from pollen sample from various plants, can be considered as a potential source of energy and nutrients for human [4].

Apitherapy, which is the medicinal use of honey bee products, has been used as a source of complementary medicine to treat a variety of acute and chronic ailments and as a functional food [5].

Honeybee pollen has been used as a beneficial food source due to the effects of its components, as it is a natural and important source of carbohydrates, proteins, amino acids, sugar, fiber, mineral salts, and vitamins (includes vitamin C, E and β carotene) [5].

A wide assay of therapeutic benefits and activities due to flavonoid glycosides of honey bee pollen is implied. These effects include, but are not limited to antioxidiant, anti-inflammatory, anti allergen, anti-ulcer, antibiotic, anticarcinogenic, sedative, immunomodulatory, anti-atherosclerotic, antiosteoporosis, as well as hepatoprotective effects. Also, pollen can be used for curing and treating diseases that are related to the cardiovascular and digestive systems [5]. Honeybee pollen is significantly rich in natural antioxidants such as polyphenols and flavonoids therefore it may show various pharmacological effects and increase the capacity of the cells which neutralize oxidative stress. Recently, most of studies have reported the importance of apitherapy and honeybee pollen in human health and food [1,3-10]. The ethnompharmacological approach, combined with chemical and biological methods, may provide useful pharmacological leads. In this regard, the present review paper is paying special attention to honeybee pollen as a functional and medicinal food.
