**Abstract**

Heterocyclic compounds have been an interesting area for the study of synthesis and biological activity of novel oxadiazole derivatives for a long time. Heterocyclic compounds possess diverse biological properties that have led to intense study and research of these compounds. One of these compounds 1,3,4-Oxadiazole is a versatile heterocyclic nucleus is a novel molecule which attract the medicinal chemist to search a new therapeutic molecule. 1,3,4-oxadizole exhibited a wide range of biological activities which includes antimicrobial activity, anti-tubercular, anticonvulsant, anti-diabetic, anti-allergic, enzyme inhibitors, anti-HIV activity, antipyretic activity, Immunosuppressive activity, Spasmyloytic Activity, antioxidant activity, Anti-Alzheimer’s activity, cardiovascular activity, anti-inflammatory, anti-tumor activity, insecticidal activity, CGRP receptor antagonists, anti-angithelemic activities. Results of various derivatives of different oxadiazole and their substitutions with diverse biological activities are reviewed in present article.

**Keywords:** 1,3,4-oxadiazoles derivatives; Pharmacological activities

**Introduction**

Oxadiazole is a five membered heterocycle having two carbons, two nitrogens, one oxygen and two double bonds having general formula C$_2$H$_2$ON$_2$. Oxadiazole is considered to be derived from furan by replacement of two methane (-CH=) group by two pyridine type nitrogen (-N=). There are four possible isomers of oxadiazole (1, 2, 3, 4) depending on the position of nitrogen atom in the ring and are numbered as shown in Figure 1.

Out of its four possible isomers, 1,3,4-oxadiazole is widely exploited for various applications. A Wide variety of substituted 1,3,4-oxadiazoles have attracted considerable attention in the field of drug discovery because of their wide range of pharmacological activities. Oxadiazoles have occupied a specific place in the field of medicinal chemistry due to its wide range of activities [1].

**Anticonvulsant Activity**

A series of new 2-substituted-5-(2-benzylthiophenyl)-1,3,4-oxadia-zoles derivatives; Pharmacological activities

Hybrids between phenytoin and thiosemicarbazide, 1,3,4-oxadiazole, 1,3,4-thiadiazole or 1,2,4-triazole were synthesized and tested for anticonvulsant activity. Preliminary anticonvulsant screening was performed using standard maximal electroshock (MES) and subcutaneous pentylenetetrazole (scPTZ) screens in mice. The neurotoxicity was determined applying the rotarod test. Among these compounds 4 showed the highest protection (80%) in the scPTZ test at a dose of 100 mg/kg [3] (Figure 3).

A series of novel 1,3,4-oxadiazole derivatives of phthalimide (4a-j) were prepared in satisfactory yields and evaluated for their anticonvulsant and neurotoxicity studies. All the compounds were active in MES screen and less neurotoxic than phentoyin. Compound 4j having methoxy substitution at para position of the distal aryl ring emerged as most promising anticonvulsant agent with low neurotoxicity [4] (Figure 4).

A series of five membered heterocyclics was synthesized by the reaction between isoniazid and various substituted isothiocyanates

and was tested for their anticonvulsant activity by determining their ability to provide protection against convulsions induced by electroconvulsometer. Among the synthesized compounds (III)f 2-(chlorophenyl)amino-5-(4-pyridyl)-1, 3, 4-oxadiazole were found promising compounds of the series [5] (Figure 5).

The azole pharmacophore is still considered a viable lead structure for the synthesis of more efficacious and broad spectrum anticonvulsant agents. The results revealed that five compounds 17,18 were able to display noticeable anticonvulsant activity in both tests at 100 mg/kg dose level [6] (Figure 6).

**Antimicrobial Activity**

Six new 5-(1-/2-naphthyloxymethyl)-1,3,4-oxadiazole-2(3H)-thione,2-amino-5-(1-/2-naphthyloxymethyl)-1,3,4-oxadiazole,5-(1-/2-naphthyloxymethyl)-1,3,4-oxadiazole 2(3H)-one derivatives have been synthesized from 1-and/or 2-naphthol. All the compounds were active against S. aureus, E. coli, P. aeruginosa, C. albicans, and C. parapsilosis at 64–256 μg/ml concentration [7] (Figure 7).

A series of new 2-amino 1, 3, 4-oxadiazoles were synthesized followed by condensation with various substituted aldehydes to yield their Schiff bases. The synthesized compounds were evaluated for their antimicrobial activity against two Gram positive bacteria two Gram negative bacteria and two fungal species yeast strains. All the synthesized compounds showed good antimicrobial activity [8] (Figure 8).

A series of 3-(5-phenyl-1,3,4-oxadiazole-2-yl)-2-(substituted styryl)-quinazoline-4(3H)-ones 3(a-h) were synthesized by reacting 2-methyl-3-(5-phenyl-1,3,4-oxadiazole-2-yl)-quinazoline-4(3H)-one All the compounds were screened for antibacterial activity by using cup plate method. Out of these compounds unsubstituted styryl compounds showed significant activity [9] (Figure 9).

Synthesized a series of (4E)-4-(2-substituted aryl hydrazono)-1-[4-[(4-acetyl-4,5-dihydro-5-methyl-5-phenyl-1,3,4-oxadiazol-2-yl)aminomethyl] phenyl]-3-methyl-1H-pyrazol-5(4H)-one. Has been found to possess antimicrobial activity [10] (Figure 10).

**Anti-HIV Activity**

The newly synthesized compounds were evaluated for their HIV inhibitory activity as reverse transcriptase inhibitors by using microtiter anti-HIV assays with CEM-SS cells or fresh human peripheral blood mononuclear cells. Compound 6b showed the highest activity with an IC_{50} value of 1.44 μM [11] (Figure 11).

**Insecticide Activity**

A series 2-(5-(Trifluoromethyl)pyridyloxylmethyl)-5-aryl-1,3,4-oxadiazole-2-thiol and 5-phenylamino derivatives.
oxadiazole derivatives. Have been designed and synthesized by four-step synthetic route. All oxadiazole have greater insecticidal activity especially those having fluorine on the benzene ring (II4&II5), exhibited a significant insecticidal activity[12] (Figure 12).

**Anti-inflammatory**

A novel series of 2-phenyl-5-(1,3-diphenyl-1H-pyrazol-4-yl)-1,3,4-oxadiazoles were designed and synthesized for selective COX-2 inhibition with potent anti-inflammatory activity. Among the compounds tested, 9g was found to be the most potent inhibitor of COX-2 with IC50 of 0.31 μM showing promising degree of anti-inflammatory activity in the carrageenan-induced rat paw edema model with ED50 of 74.3 mg/kg [13] (Figure 13).

A novel series of 2-[3-(4-bromophenyl)propan-3-one]-5-(substituted phenyl)-1,3,4-oxadiazoles (4a-n) have been synthesized from 3-(4-bromobenzoyl)propionic acid with the aim to get better anti-inflammatory and analgesic agents with minimum or without side effects [14] (Figure 14).

The synthesis of 5-(6-methyl-2-substituted 4-pyrimidinyloxymethyl)-2,3-dihydro-1,3,4-oxadiazole-2-thiones and their 3-morpholinomethyl derivatives and the results of anti-inflammatory activity in vivo are described. Most of the tested compounds exhibited anti-inflammatory activity and some of them were more active than acetylsalicylic acid [15] (Figure 15).

**Anti-Tubercular Activity**

A series of 3-[5-pyridine-5-yl] 1, 3, 4-oxadiazole-2-yl] pyridine has been synthesized. All the synthesized compounds shown to significant anti-tubercular activities. But compound 4g and 4h was found to possess better activity than others. Structure activity relationship and mass fregmentation has also been studied [16] (Figure 16).

Synthesized a series of 2-(4-nitro-pyrrol-2-yl)-5-aryl-1,3,4-oxadiazole derivatives. Compound 5e exhibited highest antitubercular activity (0.46 μg/mL) close to that of standard Isoniazid (0.40 μg/mL) [17] (Figure 17).

A series of 1,3,4 oxadiazole derivatives have been synthesized and evaluated for antitubercular activity. All the compounds have shown promising antitubercular activity when compared with the standard drug streptomycine [18] (Figure 18).

A series of 5-aryl-2-thio-1,3,4-oxadiazole derivatives were screened for their anti-mycobacterial activities against Mycobacterium tuberculosis H37Rv. The synthesized compounds 30-37 appeared to be the most active derivatives exhibiting more than 90% inhibition of mycobacterial growth at 12.5 µg/ml [19] (Figure 19).

**Cardiovascular Activity**

A series of novel substituted imidazole derivatives were synthesized and have been screened in vivo for their hypotensive and acute toxicity activities. Out of seventeen compounds eight compounds have shown good hypotensive and bradycardiac responses. Compounds 4c have shown better activity than reference drug clonidine [20] (Figure 20).
Some new (4-[3-acetyl-5-(pyridine-3-yl)-2,3-dihydro-1,3,4-oxadiazole-2-yl]phenyl acetate) derivatives has been found to possess considerable antihypertensive activity [21] (Figure 21).

**Anthelmintic Activity**

Various substituted 3-amino-1-(2,4-dinitro phenyl)-5-[(5-substituted-1,3,4-oxadiazol-2-yl)amino]-1H-pyrazole-4-carboxyamide and (5E)-5-[4-(dimethylamino) benzylidene]-3-(5-substituted-1,3,4-oxadiazol-2-yl)-2-phenyl-3,5-di hydro-4H-imidazol-4-one containing different functional groups have been synthesised by using different aromatic aldehydes and semicarbazide. All the compounds have been screened for their anthelmintic activity [22] (Figure 22).

**Antipyretic Activity**

Synthesized a series of 2-{[5'-nitroindazole-1'-methyl]-3-(p-bromophenylamino)-1,3,4-oxadiazole derivatives. All synthesized compound showed remarkable antipyretic activity, similar to that of acetylsalicylic acid [23] (Figure 23).

**Anti-Alzheimer’s Activity**

A series of 3-[(5-[1-(4-Methoxyphenyl)-1H-benzimidazol-6-yl]-1,3,4-oxadiazolyl] sulfanyl)methyl]benzonitrile derivatives has been synthesized. Among these compound 20x showed highly selective and potent GSK-3β inhibitory activity in vitro [24] (Figure 24).

**Monoamine Oxidase (MAO) Inhibitors**

A new series of 1,3,4-oxadiazole-3(2H)-carboxamide derivatives have been synthesized by direct heterocyclization reaction of substituted benzoylisocyanate with various aroylhydrazones as novel monoamine oxidase inhibitors (MAOIs). The preliminary results showed that most of the compounds 3a, 3b have moderate inhibitory activities toward MAO at the concentration of 10⁻¹⁻¹⁻⁰ M [25] (Figure 25).

Some new 5-aryl-1,3,4-oxadiazol-2(3H)-one derivatives and sulfur analogues were prepared and evaluated in vitro for their inhibitory properties on monoamine oxidase (MAO) types A and B. The most active compounds in these series acted preferentially against MAO B with I₅₀ values in the range of 1.8-0.056 μM. Compounds 23 and its oxadiazolethione analogue 33 were found to act as potent, selective and competitive MAO B inhibitors [26] (Figure 26).

**Anti-tumor Agents**

A series of 1,3,4-oxadiazole-3(2H)-carboxamide derivatives containing 1,4-benzodioxan moiety have been designed, synthesized and evaluated for their antitumor activity. Most of the synthesized compounds were proved to have potent antitumor activity and low toxicity. Among them, compound 7a showed the most potent biological activity against Human Umbilical Vein Endothelial cells [27] (Figure 27).

Recently Some new 3-(2-Methoxyphenylaminomethyl)-5-(2-bromophenyl)-1,3,4-oxadiazolone-2-thione derivatives has been found to possess considerable anti-tumor agents property [28] (Figure 28).
Antioxidant Activity

Synthesized a series of new 2-N-phenyl piperazino methylene-4-(4’-amino, 2’-nitro phenyl)-5-mercapto-1,3,4-oxadiazole derivatives. All compounds were screened for their antioxidant activity. Antioxidant activity of methanol solutions of synthesized compounds was determined by Reducing power assay and Hydrogen peroxide scavenging activity at 700 nm and 250 nm respectively [29] (Figure 29).

A series of 3,5-Bis(alkyl-1,3,4-oxadiazole-2-yl) azo dyes were synthesized by a multi-step reaction sequence. The synthesized compounds were screened for their antimicrobial and in vitro antioxidant properties [30] (Figure 30).

Potent antioxidant activity has been reported in 1-((5-(benzylthio)-1,3,4-oxadiazol-2-yl)methyl)-4,6-di-methyl-1H-pyrazolo[3,4-b] pyridin-3-amine derivatives [31] (Figure 31).

Anti-Diabetes Activity

Synthesized a series of new 5-(1-aryl-1H-tetrazol-5-ylsulfanylmethyl)-N-(2,3,4-tri-O-acetyl-b-D-xylopyranosyl)-1,3,4-oxadiazole-2-amines derivatives. Some of the synthesized compounds displayed PTP-1B inhibition and microorganism inhibition [32] (Figure 32).

Some synthesis a series of 2-(β-D-Glucopyranosyl)-5-(4-hydroxymethyl-1,2,3-triazol-1-ylmethyl)-1,3,4-oxadiazole derivatives has been also found to possess antidiabetes [33] (Figure 33).

Spasmolytic Activity

Synthesized a series 2(substituted acetyls-amino-5-alkyl-1,3,4-oxadiazoles derivatives has been found to possess considerable spasmolytic acticity. Compound GK-4 and GK-8 showed non-specific spasmolytic activity [34] (Figure 34).

Immunosuppressive Activity

A new potential lead structure 5-amino-3-methyl-4-[2-(5-amino-1,3,4-oxadiazolo)] isoxazole monohydrate, was synthesized. In vitro assays showed that the compound had a potent immunosuppressive activity [35] (Figure 35).

A series of 2-(5-(Benzylthio)-1,3,4-oxadiazol-2-yl)-5-methoxyphenol derivatives derived from 4-methoxysalicylic acid or 4-methylsalicylic acid (6a–6z) have been first synthesized for their potential immunosuppressive activity. Among them, compound 6z displayed the most potent biological activity against lymph node cells [36] (Figure 36).

Anti-allergic Activity

A new class of sila-substituted 1,3,4-oxadiazoles was synthesized

**Figure 28:** 3-(2-Methoxyphenylaminomethyl)-5-(2-bromophenyl)-1,3,4-oxadiazoline-2-thione derivatives.

**Figure 29:** 2-N-phenyl piperazino methylene-4-(4’-amino, 2’-nitro phenyl)-5-mercapto-1,3,4-oxadiazole derivatives.

Synthesis and evaluation of substituted 1,3,4-oxadiazole and substituted electrophilic are the essential pharmacophore for the pharmacological activities. The existing literature suggested that 1,3,4-oxadiazole is responsible to control the various pathological conditions. We observed that 1,3,4-oxadiazole derivatives had potent anticonvulsant, antimicrobial, anticancer properties. This ring is the new light to medicinal chemist or scientist to discover new lead target. Because of its high efficacy and lower side effect, this ring may be useful tool of new light for modern anticancer therapy.
