Abstract

Cancer is a major public health problem, almost everywhere in the world. An attempt has been made to give a note about some medicinal plants used for the prevention and treatment of cancer. Herbal medicines have a vital role in the prevention and treatment of cancer. Plants have been used for treating diseases since time immemorial. More than 50% of modern drugs in clinical use are of natural products. In the present editorial, an attempt has been made to study the plants that have been used in the treatment of cancer.

Keywords: Anticancer; Medicinal plants; Herbal medicine; Cancer treatment

Cancer is a major public health burden in both developed and developing countries. It was estimated that there were 10.9 million new cases, 6.7 million deaths, and 24.6 million persons living with cancer around the world in 2012 [1-3]. Natural products especially plants have been used for the treatment of various diseases for thousands of years. The Ebers Papyrus, the best known Egyptian pharmaceutical record which documented over 700 drugs, represents the history of Egyptian medicine dated from 1500 BC. The Chinese Materia Medica, which describes more than 600 medicinal plants, has been well documented with the first record dating from about 1100 BC. [4]. Many medicinal plants have anti-cancer activity as Allium sativum contains more than 100 biologically useful secondary metabolites, which include alliin, alliinase, allicin, Sallyl- cysteine (SAC), Diallyl disulphide (DADS), Diallyl trisulphide (DATS) and Methylallyl trisulphides [5]. Annona squamosa contains acetogenins, which possess significant cytotoxic activity against leukaemia and sarcoma. Acetogenins are found to be effective in the treatment of nasopharyngeal carcinoma [6]. Arctium lappa contains potent anticancer factors that prevent mutations in the oncogenes. It has been used in the treatment of malignant melanoma, lymphoma and cancers of the pancreas, breast, ovary, oesophagus, bladder, bile duct and the bone. A study revealed that it reduces the size of tumour, relieves the pain and prolongs the survival period [7]. Gossypium barbadense contains gossypol. Recent studies have revealed that gossypol possesses selective toxicity towards cancerous cells [8]. Glycine max is a mushroom that inhibits growth of cancer by enhancing activity of the natural killer cells. A study revealed that it inhibits carcinogenesis and metastases [8]. Egypt, a semi-arid region has abundant plants resources, which are traditionally used for various disorders. Some Egyptian flora are used as anticancer agents as Luffa aegyptiaca (sponge gourd), Solenostemma arghel (argel), Cassia italica (senegal senna), Ocimum basilicum (basil), Colocasia antiquorum (taro), Beta vulgaris (beets) and fruit of Capsicum frutescens (chili pepper). Anticancer activities of these plants were observed in vitro against acute myeloid leukemia (AML) and acute lymphocyte leukemia (ALL); and in vivo against Ehrlich as cites carcinoma cells (EACC). Solenostemma arghel hot water extract significantly reduced EACC induced tumour growth and delayed animal death (with EACC) by 29 days. Among all the extracts S. arghel showed high cytotoxicity (66-90%) on ALL and AML cells from patients [9].
