Abstract

The novel route was developed for synthesis of high potential tetrazole carbamate and urea derivatives by using conventional methods. (trifluoromethyl)phenylquipoline-5-carboxamide (3) was converted into chloroamide derivative by using POCl3 and DMF (cat), then treated with sodium azide by [3+2] cycloaddition to give 8-(benzyloxy)-5-(1-(4-(trifluoromethyl) phenyl)-1H-tetrazol-5-yl)quinoline (5). The tetrazolidine compound was debenzylated, then Alkylation with Ethyl Bromo acetate and converted to acid (8) by hydrolysis with LiOH. The acid was converted to acid azide by using DPPA, and then Treated with Alcohols and Amine to give substituted Carbamates and urea derivatives by using Curtius rearrangement.

Objective of this Research

Present work is corresponding to develop novel synthetic route for preparation of the quinoline attached tetrazolidine urea and N-carbamate derivatives and characterized by IR and 1H NMR.

Introduction

Tetrazole analogues have a potential pharmacological activity in medicinal chemistry division. Several Active pharmaceutical drug intermediates (API) of tetrazole derivatives played their role in pharmaceutical and agrochemical region. These compounds act as multidimensional biological active drug candidates such as inhibition of Angiotensin (AT1), Angiotensin (AT2) receptor (Hypertension) [1], antifungal and antibacterial [2], corrosion inhibitor [3], anti-inflammatory [4], anticancer [5,7], antioxidant [6], antifungal, analgesic [8], Antiviral [9], protein arginine deiminase inhibitor [10], antimicrobial [11,12], Anti allergic, dual Selective serotonin and Nor epinephrine Reuptake inhibitors (SSNRIs) and HIV inhibitors. When Drug model designing, tetrazole nucleolus consider as a co-sister of carboxylic acid and amide derivatives. The pka value of tetrazole is correlated with amide and acid functional groups. The introduction of tetrazole ring in drug substrate prominently increases their bioavailability and prolonging biological action and also avoid acute toxicity of drug. In Analogue-based drug discovery (ABDD), introduce tetrazole nucleolus as an important descriptor. Several research works is progress based on synthesis of tetrazole amino acid analogues, and nucleotide and nucleoside analogues instead of acid and amide functional group.

Many Tetrazole analogs were available for treatment of hypertension, such as Losartan potassium, Valsartan, Irbesartan, Candesartan and Olmesartan medoxonil. These drugs played a vital role to inhibit Angiotensin converting enzyme. They block AT1 and AT2 receptors which is located in kidney, heart, vascular smooth muscle cells, brain, and adrenal glands. The renin angiotensin system (RAS, enzyme) which is secretly produced in Kidney. Such few anti-hypertension drugs were described in Figure 1.

Tetrazole ring was widely used as a metabolically stable bioisostere for carboxy and amide functional groups in molecular design and synthesis of modified amino acids. Such analogs are described in Figure 2.

The generations of Cephalosporin Antibiotics played a vital role in diagnosis process. Huge research work has been done for development of these drug analogs shown in Figure 3.

Dave et al. synthesized 7,9-Disubstituted-7H-tetrazolo[1,5-c]pyrrolo[3,2-e]pyrimidines and evaluated their biological activity. Below compound exhibited better activity than ampicillin against all tested culture.

Subramanian et al. developed a novel route for terazole analogous of Cl-Amidines and F- Amidines.

As a part of our research work, we synthesized a high potential
tetrazolidine analogous were synthesized as a urea and carbamate
derivatives using conventional methods of cycloaddition reactions and
curtius rearrangement reactions. Present method we avoid toxic and
hazard reagents during synthesis of urea and carbamate derivatives.

**Materials and Methods**

All Amines and alcohols and Reagents collected from commercial
sources (Aldrich, Alfa Aesar), THF and Toluene were thoroughly
dried using sodium metal and benzophenone before conduct reaction.
DMF was dried using CaH. Alcohols (EtOH, MeOH) were super dried
using Grignard method (Mg, I). The Curtius rearrangement reactions
were conducted in sealed tube. These derivatives were characterized...
by using Analytical methods like IR, NMR (400 m Hz, Bruker). The melting points were recorded using on a WRS-1A Digital Melting Point Apparatus without correction. Infrared spectra were taken using an AVATAR 370 FT-IR spectrometer. $^1$HNMR, $^{13}$CNMR spectra were recorded with a Bruker spectrometer operating at 400 MHz used as a trimethylsilane as a reference and values were recorded in ppm. The progress of reaction was monitored using TLC system and I2 spray and KMnO4 TLC strain. The crude compounds were purified using column chromatography (100-200 mesh silica) and Combi-flash chromatography. The hydrogenation process was carried out using parr shaker.

**Experimental Methods**

Conclusion

Present research work, we have developed a novel route for synthesis of high potential pharmacological carbamate and urea derivatives using conventional and scalable route. We avoid by products in curtius rearrangement by using dry toluene and reactions were executed under argon atmosphere. We avoid hazard reagents like (phosgene and acid chloride methods) for preparation of urea and carbamate derivatives. We employed very easiest method for preparation of urea and carbamate derivatives and avoid side products. We are planning to these derivatives check for biological evolution. The biological evolution details will include next article.
