Journal of Patient care is an open access peer reviewed journal that publishes current development in the field of patient care. The Volume 2, Issue 3 of the journal has published two research articles, three review articles and a mini review.

In the research article Ayman et al. analyzed the characteristics of patients with advanced hepato-cellular carcinoma (HCC) and determined their need for palliative care. Authors concluded that patients with HCC require early engagement of specialized palliative care program to address the disease symptoms. Authors concluded that the sole aim of the treatment should be improving the quality of patient's life [1]. Al-Agha et al. in their research article determined the association between anthropometric measurements and dietary intake (daily, weekly and rarely) in children aged 2-18 years. Authors found that different type of nutritional elements had different effects on children's growth [2]. Seeman discussed the effect of exercises on the antipsychotic side effects. Authors concluded that the bioavailability is the reason for the increase of side effects of antipsychotic drugs in intramuscular depot form [3].

In the review article Brown discussed the expanded role of community healthcare providers in offering health care and Turabian

et al. discussed the teaching tools for training professionals working for the improvement of primary health care [4,5]. Yasser et al. discussed the outcomes of implementation of shared decision making in chronic inflammatory arthritis patients [6].
