Editorial

Thrombosis and bleeding disorders still are the major final causes of death although all statistics and published data are reporting all kind of diseases i.e. different cancers, diabetes, and allergic reactions are unfortunately the final fatal cause of all abovementioned primary diseases are either thrombosis and/or massive bleeding disorders, however. I have no statistics in hand about worldwide final fatal cause of the most diseases that are abovementioned due to different reasons.

The main reason to find out how Medici can prevent fatal consequences of Thrombosis to understand what is really happening after death of a cancer patient. Moreover, improperly reporting of the Medical Errors during treatments of different kinds of patients results in bias in judgements and having conclusive results. At second there are 7 minor but important reasons why Medical Researchers have to pay more attention to fatal causes of thrombosis and bleeding disorders namely: 1. Again medical errors, 2. (epi-)genetically mutations, 3. Miscommunications between different responsible (para-) Medici, 4. Abuse of (un-)known drugs due to financial interests, 5. Side effects of (un-)known drugs, 6. Underestimating of establishment of patient

response to (un-) known anticoagulants and different drugs, 7. Stopping of research/ development/education investigations to tackle new unknown causes. While all governments are stopping to support Research and developments studies thrombosis and bleeding disorders affected by mutated-sophisticated- and progressed synthetic and natural agents. Just to mention a few new causes of diseases, which finally results in thrombosis and bleeding disorders One might look at financial interests of all responsible organizations around thrombosis and bleeding disorders, who more thinking of profitable actions than educational and developmental reactions.

Taken together, in the near future patients and their family should only gather money to get best possible treatments and forget to be treated properly. Almost all pharmacy and insurance Companies are negotiating about the price and how they can satisfy the Medici to use their (u-known drugs on poor patients without alternatives. There enough increasing evidence-based studies, which indicate so much medical errors, unfortunately. In this era which all Medici and responsible organizations should take a lead to monitor independently; we need answers to the following question 'why still thrombosis and bleeding disorders kill our dear patients?.'
