### Abstract

There are infinitely many pairs of consecutive primes which differ by even number  $E_n$ . Let  $P_o(N, E_n)$  be the number of Polignac Prime Pairs (which difference by the even integer  $E_n$ ) less than an integer  $(N+E_n)$ ,  $P_{ei}$  be taken over the odd prime divisors of the even integer  $E_n$  less than  $\sqrt{(N+E_n)}$ ,  $P_{ni}$  be taken over the odd primes less than  $\sqrt{(N+E_n)}$  except  $P_{ei}$ ,  $P_i$  be taken over the odd primes less than  $\sqrt{(N+E_n)}$ , then exists the formulas as follows:

$$P_o(N, E_n) \geq \text{INT} \{N \times (1-1/2) \times \prod (1-1/P_{ei}) \times \prod (1-2/P_{ni})\} - 1$$

$$\geq \text{INT} \{C_{twin} \times K_e(N) \times 2N/(\ln(N+E_n))^2\} - 1$$

$$P_o(N, 2) \geq \text{INT} \{0.660 \times 1.000 \times 2N/(\ln(N+2))^2\} - 1$$

$$\prod (P_i(P_i-2)/(P_i-1)^2) \geq C_{twin}=0.6601618158\dots$$

$$K_e(N)=\prod ((1-1/P_{ei})/(1-2/P_{ei}))=\prod ((P_{ei}-1)/(P_{ei}-2)) \geq 1$$

where -1 is except the natural integer 1.

**Keywords:** Twin prime, Polignac prime, Bilateral sieve method

### Introduction

In number theory, Polignac's conjecture was made by Alphonse de Polignac in 1849 and states: For any positive even number  $E_n$ , there are infinitely many prime gaps of size  $E_n$ . In other words: There are infinitely many cases of two consecutive prime numbers with difference  $E_n$  [1].

The conjecture has not yet been proven or disproven for a given value of  $E_n$ . In 2013 an important breakthrough was made by Zhang Yitang who proved that there are infinitely many prime gaps of size  $E_n$  for some value of  $E_n < 70,000,000$  [2].

For  $E_n=6$ , it says there are infinitely many primes  $(p, p+6)$ . For  $E_n=4$ , it says there are infinitely many cousin primes  $(p, p+4)$ . For  $E_n=2$ , it is the twin prime conjecture that there are infinitely many twin primes  $(p, p+2)$  as shown in Figure 1. For  $E_n=0$ , it is the new prime theorem.

### The Polignac Prime of Even Integer

For an any even integer  $E_n$  there exists a prime  $P$  for which the Polignac number  $Q=E_n+P$  is also prime. The Polignac Prime pairs shall be denoted by the representation  $E_n=Q-P=(E_n+P)-P$ , where  $P$  and  $Q$  are primes and prime  $P\{P \leq Q\}$  is a Polignac prime of even integer  $E_n$ . Looking at the Polignac partition a different way, we can look at the number of distinct representations (or Polignac primes) that exist for  $E_n$ .

For example, as noted at the beginning of this discussion:

$$2=05-03=(2+03)-03; 2=07-05=(2+05)-05;$$

$$2=13-11=(2+11)-11; 2=19-17=(2+17)-17;$$

$$2=31-29=(2+29)-29; 2=43-41=(2+41)-41;$$

$$2=61-59=(2+59)-59; 2=73-71=(2+71)-71;$$

where 3, 5, 11, 17, 29, 41, 59 and 71 are Polignac primes of even integer 2.

$$4=07-03=(4+03)-03; 4=11-07=(4+07)-07;$$

$$4=17-13=(4+13)-13; 4=23-19=(4+19)-19;$$

$$4=41-37=(4+37)-37; 4=47-43=(4+43)-43;$$

$$4=71-67=(4+67)-67; 4=83-79=(4+79)-79;$$

where 3, 7, 13, 19, 37, 43, 67 and 79 are Polignac primes of even integer 4.

$$6=11-05=(6+05)-05; 6=13-07=(6+07)-07;$$

$$6=17-11=(6+11)-11; 6=19-13=(6+13)-13;$$

$$6=23-17=(6+17)-17; 6=29-23=(6+23)-23;$$

$$6=37-31=(6+31)-31; 6=43-37=(6+37)-37;$$

$$6=47-41=(6+41)-41; 6=53-47=(6+47)-47;$$

$$6=59-53=(6+53)-53; 6=67-61=(6+61)-61;$$

$$6=73-67=(6+67)-67; 6=79-73=(6+73)-73;$$

$$6=89-83=(6+83)-83; 6=103-97=(6+97)-97;$$

where 5, 7, 11, 13, 17, 23, 31, 37, 41, 47, 53, 61, 67, 73, 83 and 97 are Polignac primes of even integer 6.

It shows that generally the number of distinct representations (or Polignac primes) increases with increasing  $N$ .

### The Sieve Method about the Polignac Primes

Let  $E_n$  is an any even integer,  $C_i$  is a positive integer more not large than  $N$ , then exists the formula as follows:

Figure 1: Riemann prime counting function with new prime number theorem.

$$En = (En + Ci) - Ci \quad (1)$$

where  $Ci$  and  $En + Ci$  are two positive integers more not large than  $N + En$ .

If  $Ci$  and  $En + Ci$  any one can be divided by the prime anyone more not large than  $\sqrt{N + En}$ , then sieves out the positive integer  $Ci$ ; If both  $Po$  and  $En + Po$  can not be divided by all primes more not large than  $\sqrt{N + En}$ , then both the  $Po$  and  $En + Po$  are primes at the same time, where the prime  $Po$  is a Polignac prime of even integer  $En$ .

### The Total of Representations of Even Integer

Let  $En$  is an any even integer, then exists the formula as follows:

$$En = (En + Ci) - Ci \quad (2)$$

where  $Ci$  is the natural integer less than  $N$ .

In terms of the above formula we can obtain the array as follows:

$$(En + 1, 1), (En + 2, 2), (En + 3, 3), (En + 4, 4), (En + 5, 5), \dots, (En + N, N).$$

From the above arrangement we can obtain the formula about the total of Polignac numbers of even integer  $En$  as follows:

$$Ci(N, En) = N = \text{Total of integers } Ci \text{ more not large than } N \quad (3)$$

### The Bilateral Sieve Method of Even Prime 2

It is known that the number 2 is an even prime, and above arrangement from  $(En + 1, 1)$  to  $(En + N, N)$  can be arranged to the form as follows:

$$(En + 1, 1), (En + 3, 3), (En + 5, 5), \dots, (En + N - X, X < 2, N - X, X < 2).$$

$$(En + 2, 2), (En + 4, 4), (En + 6, 6), \dots, (En + N - X, X < 2, N - X, X < 2),$$

From the above arrangement we can known that: Because the even integer  $En$  can be divided by the even prime 2, therefore, both  $Ci$  and  $En + Ci$  can be or can not be divided by the even prime 2 at the same time.

The number of integers  $Ci$  that  $Ci$  and  $En + Ci$  anyone can be divided by the even prime 2 is  $\text{INT}(N \times (1/2))$ .

The number of integers  $Ci$  that both  $Ci$  and  $En + Ci$  can not be divided by the even prime 2 is  $N - \text{INT}(N \times (1/2)) = \text{INT}\{N - N \times (1/2)\} = \text{INT}\{N \times (1 - 1/2)\}$ .

The density of integers  $Ci$  that both  $Ci$  and  $En + Ci$  can not be divided by the even prime 2 (or the ratio of the number of integers  $Ci$

that both  $Ci$  and  $En + Ci$  can not be divided by the even prime 2 to the total of integers  $Ci$  more not large than  $N$ ) as follows:

$$Si(N, En, 2) = \text{INT}(N \times (1/2)), Ci(N, En, 2) = N - Si(N, En, 2) \quad (4)$$

$$Di(N, En, 2) = Ci(N, En, 2) / (N) = \text{INT}\{N \times (1 - 1/2)\} / N \quad (5)$$

### The Bilateral Sieve Method of Odd Prime 3

It is known that the number 3 is an odd prime, and above arrangement from  $(En + 1, 1)$  to  $(En + N, N)$  can be arranged to the form as follows:

$$(En + 1, 1), (En + 4, 4), (En + 7, 7), \dots, (En + N - X, X < 3, N - X, X < 3),$$

$$(En + 2, 2), (En + 5, 5), (En + 8, 8), \dots, (En + N - X, X < 3, N - X, X < 3),$$

$$(En + 3, 3), (En + 6, 6), (En + 9, 9), \dots, (En + N - X, X < 3, N - X, X < 3).$$

From the above arrangement we can known that:

If the even integer  $En$  can be divided by odd prime 3, then both the  $Ci$  and  $En + Ci$  can be or can not be divided by odd prime 3 at the same time.

The number of integers  $Ci$  that the  $Ci$  and  $En + Ci$  anyone can be divided by odd prime 3 is  $\text{INT}(N \times (1/3))$ .

The number of integers  $Ci$  that both  $Ci$  and  $En + Ci$  can not be divided by odd prime 3 is  $N - \text{INT}(N \times (1/3)) = \text{INT}\{N - N \times (1/3)\} = \text{INT}\{N \times (1 - 1/3)\}$ .

The density of integers  $Ci$  that both  $Ci$  and  $En + Ci$  can not be divided by odd prime 3 (or the ratio of the number of integers  $Ci$  that both  $Ci$  and  $En + Ci$  can not be divided by the odd prime 3 to the total of integers  $Ci$  more not large than  $N$ ) as follows:

$$Sei(N, En, 3) = \text{INT}(N \times (1/3)), Cei(N, En, 3) = N - Sei(N, En, 3) \quad (6)$$

$$Dei(N, En, 3) = Cei(N, En, 3) / (N) = \text{INT}\{N \times (1 - 1/3)\} / N \quad (7)$$

If the even integer  $En$  can not be divided by the odd prime 3, then both  $Ci$  and  $En + Ci$  can not be divided by the odd prime 3 at the same time, that is the  $Ci$  and  $En + Ci$  only one can be divided or both the  $Ci$  and  $En + Ci$  can not be divided by the odd prime 3.

The number of integers  $Ci$  that the  $Ci$  and  $En + Ci$  anyone can be divided by the odd prime 3 is  $\text{INT}(N \times (2/3))$ .

The number of integers  $Ci$  that both the  $Ci$  and  $En + Ci$  can not be divided by the odd prime 3 is  $N - \text{INT}(N \times (2/3)) = \text{INT}\{N - N \times (2/3)\} = \text{INT}\{N \times (1 - 2/3)\}$ .

The density of integers  $Ci$  that both  $Ci$  and  $En + Ci$  can not be divided by odd prime 3 (or the ratio of the number of integers  $Ci$  that both  $Ci$  and  $En + Ci$  can not be divided by the odd prime 3 to the total of integers  $Ci$  more not large than  $N$ ) as follows:

$$Sni(N, En, 3) = \text{INT}(N \times (2/3)), Cni(N, En, 3) = N - Sni(N, En, 3) \quad (8)$$

$$Dni(N, En, 3) = Cni(N, En, 3) / (N) = \text{INT}\{N \times (1 - 2/3)\} / N \quad (9)$$

### The Bilateral Sieve Method of Odd Prime 5

It is known that the number 5 is an odd prime, and above arrangement from  $(En + 1, 1)$  to  $(En + N, N)$  can be arranged to the form as follows:

$$(En + 1, 1), (En + 6, 6), (En + 11, 11), \dots, (En + N - X, X < 5, N - X, X < 5),$$

$$(En + 2, 2), (En + 7, 7), (En + 12, 12), \dots, (En + N - X, X < 5, N - X, X < 5),$$

$$(En + 3, 3), (En + 8, 8), (En + 13, 13), \dots, (En + N - X, X < 5, N - X, X < 5),$$

$(En+4, 4), (En+09, 09), (En+14, 14), \dots, (En+N-X: X < 5, N-X: X < 5),$   
 $(En+5, 5), (En+10, 10), (En+15, 15), \dots, (En+N-X: X < 5, N-X: X < 5).$

From the above arrangement we can know that:

If the even integer  $En$  can be divided by odd prime 5, then both the  $Ci$  and  $En+Ci$  can be or can not be divided by odd prime 5 at the same time.

The number of integers  $Ci$  that the  $Ci$  and  $En+Ci$  anyone can be divided by odd prime 5 is  $INT(N \times (1/5))$ .

The number of integers  $Ci$  that both  $Ci$  and  $En+Ci$  can not be divided by odd prime 5 is  $N-INT(N \times (1/5))=INT\{N-N \times (1/5)\}=INT\{N \times (1-1/5)\}$ .

The density of integers  $Ci$  that both  $Ci$  and  $En+Ci$  can not be divided by odd prime 5 (the ratio of the number of integers  $Ci$  that both  $Ci$  and  $En+Ci$  can not be divided by odd prime 5 to the total of integers  $Ci$  more not large than  $N$ ) as follows:

$$Sei(N, En, 5)=INT(N \times (1/5)), Cei(N, En, 5)=N-Sei(N, En, 5) \quad (10)$$

$$Dei(N, En, 5)=Cei(N, En, 5)/(N)=INT\{N \times (1-1/5)\}/N \quad (11)$$

If the even integer  $En$  can not be divided by the odd prime 5, then both  $Ci$  and  $En+Ci$  can not be divided by the odd prime 5 at the same time, that is the  $Ci$  and  $En+Ci$  only one can be divided or both the  $Ci$  and  $En+Ci$  can not be divided by the odd prime 5.

The number of integers  $Ci$  that the  $Ci$  and  $En+Ci$  anyone can be divided by the odd prime 5 is  $INT(N \times (2/5))$ .

The number of integers  $Ci$  that both the  $Ci$  and  $En+Ci$  can not be divided by the odd prime 5 is  $N-INT(N \times (2/5))=INT\{N-N \times (2/5)\}=INT\{N \times (1-2/5)\}$ .

The density of integers  $Ci$  that both  $Ci$  and  $En+Ci$  can not be divided by odd prime 5 (or the ratio of the number of integers  $Ci$  that both  $Ci$  and  $En+Ci$  can not be divided by the odd prime 5 to the total of integers  $Ci$  more not large than  $N$ ) as follows:

$$Sni(N, En, 5)=INT(N \times (2/5)), Cni(N, En, 5)=N-Sni(N, En, 5) \quad (12)$$

$$Dni(N, En, 5)=Cni(N, En, 5)/(N)=INT\{N \times (1-2/5)\}/N \quad (13)$$

## The Sieve Function of Bilateral Sieve Method

Let  $En$  is an even integer, then exists the formula as follows:

$$En=(En+Ci)-Ci \quad (14)$$

where  $Ci$  is the natural integer less than  $N$ .

In terms of the above formula we can obtain the array as follows:

$(En+1, 1), (En+2, 2), (En+3, 3), (En+4, 4), (En+5, 5), \dots, (En+N, N).$

Let  $Pi$  be an odd prime less than  $\sqrt{(N+En)}$ , then the above arrangement can be arranged to the form as follows:

$(En+1, 1), (En+Pi+1, Pi+1), \dots, (En+N-X: X < Pi, N-X: X < Pi),$

$(En+2, 2), (En+Pi+2, Pi+2), \dots, (En+N-X: X < Pi, N-X: X < Pi),$

$(En+3, 3), (En+Pi+3, Pi+3), \dots, (En+N-X: X < Pi, N-X: X < Pi),$

$(En+Pi, Pi), (En+2Pi, 2Pi), \dots, (En+N-X: X < Pi, N-X: X < Pi).$

If the even integer  $En$  can be divided by the odd prime  $Pei$ , then both the  $Ci$  and  $En+Ci$  can be or can not be divided by the odd prime  $Pei$  at the same time.

The number of integers  $Ci$  that the  $Ci$  and  $En+Ci$  anyone can be divided by the odd prime  $Pei$  is  $INT(N \times (1/Pei))$ .

The number of integers  $Ci$  that both the  $Ci$  and  $En+Ci$  can not be divided by the odd prime  $Pei$  is  $N-INT(N \times (1/Pei))=INT\{N-N \times (1/Pei)\}=INT\{N \times (1-1/Pei)\}$

The density of integers  $Ci$  that both the  $Ci$  and  $En+Ci$  can not be divided by the odd prime  $Pei$  (or the ratio of the number of integers  $Ci$  that both the  $Ci$  and  $En+Ci$  can not be divided by the odd prime  $Pei$  to the total of integers  $Ci$  more not large than  $N$ ) as follows:

$$Sei(N, En, Pei)=INT(N \times (1/Pei)), Cei(N, En, Pei)=N-Sei(N, En, Pei) \quad (15)$$

$$Dei(N, En, Pei)=Cei(N, En, Pei)/(N)=INT\{N \times (1-1/Pei)\}/N \quad (16)$$

If the even integer  $En$  can not be divided by the odd prime  $Pni$ , then both the  $Ci$  and  $En+Ci$  can not be divided by the odd prime  $Pni$  at the same time, that is the  $Ci$  and  $En+Ci$  only one can be divided or both the  $Ci$  and  $En+Ci$  can not be divided by the odd prime  $Pni$ .

The number of integers  $Ci$  that the  $Ci$  and  $En+Ci$  anyone can be divided by the odd prime  $Pni$  is  $INT(N \times (2/Pni))$ .

The number of integers  $Ci$  that both the  $Ci$  and  $En+Ci$  can not be divided by the odd prime  $Pni$  is  $N-INT(N \times (2/Pni))=INT\{N-N \times (2/Pni)\}=INT\{N \times (1-2/Pni)\}$ .

The density of integers  $Ci$  that both the  $Ci$  and  $En+Ci$  can not be divided by the odd prime  $Pni$  (or the ratio of the number of integers  $Ci$  that both the  $Ci$  and  $En+Ci$  can not be divided by the odd prime  $Pni$  to the total of integers  $Ci$  more not large than  $N$ ) as follows:

$$Sni(N, En, Pni)=INT(N \times (2/Pni)), Cni(N, En, Pni)=N-Sni(N, En, Pni) \quad (17)$$

$$Dni(N, En, Pni)=Cni(N, En, Pni)/(N)=INT\{N \times (1-2/5)\}/N \quad (18)$$

Let  $Po(N, En)$  be the number of Polignac Prime Pairs (which difference by the even integer  $En$ ) less than an integer  $(N+En)$ ,  $Pei$  be taken over the odd prime divisors of the even integer  $En$  less than  $\sqrt{(N+En)}$ ,  $Pni$  be taken over the odd primes less than  $\sqrt{(N+En)}$  except  $Pei$ ,  $Pi$  be taken over the odd primes less than  $\sqrt{(N+En)}$ , then exists the formulas as follows:

$$Po(N, En) \geq INT\{N \times Di(N, En, 2) \times \prod Dei(N, En, Pei) \times \prod Dni(N, En, Pni)\} - 1$$

$$=INT\{N \times (1-1/2) \times \prod (1-1/Pei) \times \prod (1-2/Pni)\} - 1 \quad (19)$$

where -1 is except the natural integer 1.

## The Polignac Prime Theorem

From above we can obtain that:

Let  $Po(N, En)$  be the number of Polignac Prime Pairs (which difference by the even integer  $En$ ) less than an integer  $(N+En)$ ,  $Pei$  be taken over the odd prime divisors of the even integer  $En$  less than  $\sqrt{(N+En)}$ ,  $Pni$  be taken over the odd primes less than  $\sqrt{(N+En)}$  except  $Pei$ ,  $Pi$  be taken over the odd primes less than  $\sqrt{(N+En)}$ , then exists the formulas as follows:

$$Po(N, En) \geq INT\{N \times Di(N, En, 2) \times \prod Dei(N, En, Pei) \times \prod Dni(N, En, Pni)\} - 1$$

$$=INT\{N \times (1-1/2) \times \prod (1-1/Pei) \times \prod (1-2/Pni)\} - 1 \quad (20)$$

Apply the Prime Number Theorem as follows:

Let  $P_i(N)$  be the number of primes less than or equal to  $N$ ,  $P_i(3 \leq P_i \leq P_m)$  be taken over the odd primes less than  $\sqrt{N}$ , then exists the formulas as follows:

$$P_i(N | N \geq 10^4) = \text{INT} \{N \times (1-1/2) \times \prod (1-1/P_i) + m + 1\} - 1 \quad (21)$$

$$\geq \text{INT} \{N \times (1-1/2) \times \prod (1-1/P_i)\} - 1 \geq \text{INT} \{N/\ln(N)\} - 1 \quad (22)$$

$$\prod (P_i(P_i-2)/(P_i-1)^2) \geq \text{Ctwin} = 0.6601618158... \quad (23)$$

$$K_e(N) = \prod ((1-1/P_i)/(1-2/P_i)) = \prod ((P_i-1)/(P_i-2)) \geq 1 \quad (24)$$

From the above and the formula (20) we can obtain the formula as follows:

$$P_o(N | N \geq 10^4, E_n) \geq \text{INT} \{N \times (1-1/2) \times \prod (1-1/P_i) \times \prod (1-2/P_{ni})\} - 1 \quad (25)$$

$$\geq \text{INT} \{\text{Ctwin} \times K_e(N) \times 2N/(\ln(N+E_n))^2\} - 1 \quad (26)$$

$$\geq \text{Ctwin} \times K_e(N) \times 2N/(\ln(N+E_n))^2 - 2 \quad (27)$$

When the number  $N \rightarrow \infty$ , we can obtain the formula as follows:

$$P_o(N | N \rightarrow \infty, E_n) \geq \text{Ctwin} \times K_e(N) \times 2N/(\ln(N+E_n))^2 - 2 \quad (28)$$

$$\geq 0.660 \times 1.000 \times 2N/(\ln(N+E_n))^2 - 2 \rightarrow \infty \quad (29)$$

The above formula expresses that there are infinitely many pairs of Polignac primes which differ by every even number  $E_n$ .

When the  $E_n=2$ , then there are infinitely many twin primes.

## Every Even Integer Greater than Four Can be Expressed as a Sum of Two Odd Primes

Every even integer greater than four can be expressed as a sum of two odd primes, and exists the formula as follows:

$$G_p(N) \geq \text{INT}\{K_{pc} \times \text{Ctwin} \times N/(\ln N)^2\} - 1 \geq \text{INT}\{0.66016 \times N/(\ln N)^2\} - 1 \geq 185 > 1$$

where the  $G_p(N)$  be the number of primes  $P$  with  $N-P$  primes, or, equivalently, the  $G_p(N)$  be the number of ways of writing  $N$  as a sum of two primes, the  $N$  be the even integer greater than 30000.

## The proof method of Goldbach's conjecture

The Goldbach's Conjecture is one of the oldest unsolved problems in Number Theory. In its modern form, it states that every even integer greater than two can be expressed as a sum of two primes.

Let  $N$  be an even integer greater than 2, and let  $N=(N-G_p)+G_p$ , with  $N-G_p$  and  $G_p$  prime numbers, the  $G_p\{G_p \leq N/2\}$  be a Goldbach Prime of even integer  $N$ . Let  $G_p(N)$  be the number of Goldbach Primes of even integer  $N$ . The number of ways of writing  $N$  as a sum of two prime numbers, when the order of the two primes is important, is thus  $GP(N)=2G_p(N)$  when  $N/2$  is not a prime and is  $GP(N)=2G_p(N)-1$  when  $N/2$  is a prime. The Goldbach's Conjecture states that  $G_p(N) > 0$ , or, equivalently, that  $GP(N) > 0$ , for every even integer  $N$  greater than two.

We known that the Goldbach's Conjecture is true for every even integer  $N$  no greater than 30000, therefore, we only need to prove that the Goldbach's Conjecture is true for every even integer  $N$  greater than 30000, that is:  $G_p(N | N > 30000) \geq 1$ .

TWO: The Sieve Method about the Goldbach Primes

Let  $N$  be an even integer greater than 30000, then the even integer  $N$  can be expressed to the form as follows:

$$N=(N-G_n)+G_n, G_n \leq N/2 \quad (1)$$

where  $G_n$  be the positive integer no greater than  $N/2$ .

## Sieve method

Let  $N-G_n$  and  $G_n$  are two positive integers, if  $N-G_n$  and  $G_n$  any one can be divisible by the prime  $P$ , then sieves the positive integer  $G_n$ ; if both the  $N-G_p$  and  $G_p$  can not be divisible by the all primes no greater than  $\sqrt{N}$ , then both the  $N-G_p$  and  $G_p$  are primes at the same time, the prime  $G_p$  be called the Goldbach Prime of even integer  $N$ .

**Theorem 1:** Let  $P_c$  be an odd prime factor of even integer  $N$  and no greater than  $\sqrt{N}$ , then the ratio of the number of integers  $G_p$  that both the  $N-G_p$  and  $G_p$  can not be divisible by the prime  $P_c$  to the total of integers  $G_n$  no greater than  $N/2$  is follows:

$$R(N, P_c) = \text{INT}\{N/2 - N/2/P_c\}/(N/2) = \{\text{INT}(N/2) - \text{INT}(N/2/P_c)\}/(N/2)$$

**Proof:** Because  $P_c$  is an odd prime factor of even integer  $N$ , therefore, both the  $N-G_n$  and  $G_n$  can or can not be divisible by prime  $P_c$  at the same time, then the number of integers  $G_n$  that the  $N-G_n$  and  $G_n$  any one can be divisible by the prime  $P_c$  is  $\text{INT}\{(N/2)/P_c\}$ , the number of integers  $G_n$  that both the  $N-G_n$  and  $G_n$  can not be divisible by the prime  $P_c$  is  $\{\text{INT}(N/2) - \text{INT}(N/2/P_c)\} = \text{INT}\{N/2 - N/2/P_c\}$ , the ratio of the number of integers  $G_n$  that both the  $N-G_n$  and  $G_n$  can not be divisible by the prime  $P_c$  to the total of integers  $G_n$  no greater than  $N/2$  is follows:

$$R(N, P_c) = \{\text{INT}(N/2) - \text{INT}(N/2/P_c)\}/(N/2) = \text{INT}\{N/2 - N/2/P_c\}/(N/2) \quad (2)$$

**Theorem 2:** Let  $P_n$  be an odd prime no factor of even integer  $N$  and no greater than  $\sqrt{N}$ , then the ratio of the number of integers  $G_n$  that both the  $N-G_n$  and  $G_n$  can not be divisible by the prime  $P_n$  to the total of integers  $G_n$  no greater than  $N/2$  is follows:

$$R(N, P_n) = \text{INT}\{N/2 - N/P_n\}/(N/2) = \{\text{INT}(N/2) - \text{INT}(N/P_n)\}/(N/2)$$

**Proof:** Because the  $P_n$  is an odd prime no factor of even integer  $N$ , therefore, both the  $N-G_n$  and  $G_n$  can not be divisible by the prime  $P_n$  at the same time, that is the  $N-G_n$  and  $G_n$  only one can be divisible or both the  $N-G_n$  and  $G_n$  can not be divisible by the prime  $P_n$ , then the number of integers  $G_n$  that the  $N-G_n$  and  $G_n$  any one can be divisible by the prime  $P_n$  is  $\text{INT}\{N/P_n\}$ , the number of integers  $G_n$  that both the  $N-G_n$  and  $G_n$  can not be divisible by the prime  $P_n$  is  $\{\text{INT}(N/2) - \text{INT}(N/P_n)\} = \text{INT}\{N/2 - N/P_n\}$ , the ratio of the number of integers  $G_n$  that both the  $N-G_n$  and  $G_n$  can not be divisible by the prime  $P_n$  to the total of integers  $G_n$  no greater than  $N/2$  is follows:

$$R(N, P_n) = \{\text{INT}(N/2) - \text{INT}(N/P_n)\}/(N/2) = \text{INT}\{N/2 - N/P_n\}/(N/2) \quad (3)$$

**Theorem 3:** The integer 2 is an even prime factor of even integer  $N$ , the ratio of the number of integers  $G_n$  that both the  $N-G_n$  and  $G_n$  can not be divisible by the even prime 2 to the total of integers  $G_n$  no greater than  $N/2$  is follows:

$$R(N, 2) = \text{INT}\{N/2 - N/2/2\}/(N/2) = \{\text{INT}(N/2) - \text{INT}(N/2/2)\}/(N/2)$$

**Proof:** Because the 2 is an even prime factor of even integer  $N$ , therefore, both the  $N-G_n$  and  $G_n$  can be divisible or can not be divisible by the even prime 2 at the same time, then the number of integers  $G_n$  that the  $N-G_n$  and  $G_n$  any one can be divisible by the even prime 2 is  $\text{INT}\{N/2/2\}$ , the number of integers  $G_n$  that both the  $N-G_n$  and  $G_n$  can not be divisible by the even prime 2 is  $\{\text{INT}(N/2) -$

$\text{INT}(N/2/2) = \text{INT}\{N/2 - N/2/2\}$ , the ratio of the number of integers  $G_n$  that both the  $N-G_n$  and  $G_n$  can not be divisible by the even prime 2 to the total of integers  $G_n$  no greater than  $N/2$  is follows:

$$R(N,2) = \{\text{INT}(N/2) - \text{INT}(N/2/2)\} / (N/2) = \text{INT}\{N/2 - N/2/2\} / (N/2) \quad (4)$$

Three: The Number of Goldbach Primes of Even Integer

Let  $G_p(N)$  be the number of Goldbach primes of even integer  $N$ , let  $G_p(N, P_n)$  be the number of Goldbach primes no greater than  $\sqrt{N}$ , then exists the formulas as follows:

$$\begin{aligned} G_p(N) &= \text{INT}\{(N/2) \times R(N,2) \times \prod (N, P_{ci}) \times \prod (N, P_{ni})\} + G_p(N, P_{ni}) - 1 \text{ (if } N-1 \text{ prime)} \\ &= \text{INT}\{(N/2) \times (1-1/2) \times \prod (1-1/P_{ci}) \times \prod (1-2/P_{ni})\} + G_p(N, P_{ni}) - 1 \text{ (if } N-1 \text{ prime)} \end{aligned} \quad (5)$$

Where  $P_{ci}$  and  $P_{ni}$  are odd primes no greater than  $\sqrt{N}$ .

Let  $P_i(N)$  be the number of primes less than an integer  $N$ , then, be the formula as follows:

$$P_i(N) \equiv \text{INT}\{N \times (1-1/P_1) \times (1-1/P_2) \times \dots \times (1-1/P_m) + m - 1\} \equiv P(N) + P_i(\sqrt{N}) - 1$$

$$P_i(N) \approx \text{Psha}(N) \equiv \text{Li}(N) - 1/2 \times \text{Li}(N^{0.5})$$

$$P(N \geq N \geq 10^9) \geq 2 / (1 + \sqrt{1 - 4/\ln(N)}) \times N / \ln(N) \geq N / (\ln(N) - 1)$$

$$P(N \geq N \geq 10^4) \equiv \text{INT}\{N \times (1-1/2) \times \prod (1-1/P_i)\} \geq N / \ln(N) \quad (6)$$

## The Proof of Goldbach's Conjecture

Theorem 4: Every even integer greater than 30000 can be expressed as a sum of two odd primes.

Proof: According to the formula (5),

We can obtain the formula as follows:

$$G_p(N) + 1 \geq \text{INT}\{(N/2) \times (1-1/2) \times \prod (1-1/P_{ci}) \times \prod (1-2/P_{ni})\}$$

$$\begin{aligned} &= \text{INT}\{(N/2) \times (1-1/2) \times \prod ((P_{ci}-1)/(P_{ci}-2)) \times \prod (1-2/P_{ci}) \times \prod (1-2/P_{ni})\} \\ &= \text{INT}\{(N/2) \times (1-1/2) \times \prod ((P_{ci}-1)/(P_{ci}-2)) \times \prod (1-2/P_i)\} \\ &= \text{INT}\{(N/2) \times (1-1/2) \times K_{pc} \times \prod (1-2/P_i) / \prod (1-1/P_i)^2 \times \prod (1-1/P_i)^2\} \\ &= \text{INT}\{(N/2) \times (1-1/2) \times K_{pc} \times \prod (1-1/(P_i-1)^2) \times \prod (1-1/P_i)^2\} \\ &\geq \text{INT}\{(N/2) \times (1-1/2) \times K_{pc} \times C_{twin} \times \prod (1-1/P_i)^2\} \end{aligned} \quad (7)$$

Apply the formula (6), we can obtain the formula as follows:

$$\begin{aligned} G_p(N \mid N \geq 30000) &\geq \text{INT}\{(N/2) \times (1-1/2) \times K_{pc} \times C_{twin} \times \prod (1-1/P_i)^2\} - 1 \\ &\geq \text{INT}\{K_{pc} \times C_{twin} \times N / \ln(N)^2\} - 1 \geq \text{INT}\{0.66016 \times N / \ln(N)^2\} - 1 \\ &\geq \text{INT}\{0.66016 \times (30000) / \ln(30000)^2\} - 1 = \text{INT}\{186.355\dots\} - 1 = 185 > 1 \end{aligned} \quad (8)$$

From above formula (8) we can obtain that:

Every even integer greater than 30000 can be expressed as a sum of two odd primes.

## Conclusion

For every even integer  $E_n$  there are infinitely many pairs of Polignac primes which difference by  $E_n$ .

When the  $E_n=0$ , we can obtain New Prime Number Theorem: Let  $P_i(N)$  be the number of primes less than or equal to  $N$ , for any real number  $N$ , the New Prime Number Theorem can be expressed by the formula as follows:  $P_i(N) = R(N) + K \times (\text{Li}(N) - R(N))$ ,  $1 > K > -1$ . The Goldbach's Conjecture is a Complete Correct Theorem.
