Prevalence of Vitamin D Deficiency in Obstructive Sleep Apnea Disorder in Dubai, UAE

Fatehrahman Shendi*, Bassam Mahboub, Hassan Alhariri and Annie Soans
Sleep Disorders Center, Department of Medicine, Rashid Hospital, Dubai Health Authority, Dubai United Arab Emirates

Abstract

Purpose: Sleep disorders have become epidemic throughout the worldwide, at the same time due to Multiple social changes, the same thing can be said for the vitamin D deficiency disorders, including the use of air conditioning and sunscreen, have produced a world-wide epidemic of vitamin D deficiency, then taking in consideration the proposed concept that since vitamin D plays an important role in the brainstem control of sleep, which is supported by the presence of vitamin D receptors in same areas are considered to play a role in the initiation and maintenance of sleep, this relation may not be strong as causative association but presence of either may have worsening effect on the other.

Methods: The aim of our study was to investigate the prevalence of between serum 25-hydroxy [25 (OH)] vitamin D levels and severity of disease in patients with OSAS, among the cosmopolitan (multi-national) population of Dubai, United Arab Emirates. Two hundred and sixty nine (269) patients were included in the study, all who were referred to the sleep clinic at Rashid hospital – Dubai health Authority, during the period of three years from 2012 to 2014. Serum 1-25 Di Hydroxy Chole Caciferol (vitamin D), were evaluated.

Results: Among the 148 patients who had OSA; those who were vitamin D deficient represent 16.1% of the Mild OSA group, 7.3% of the moderate OSA group and 7.9% of the Severe OSA group, while at the same time those who were vitamin D insufficient represent 29% of the Mild OSA group, 39% of the moderate OSA group and 31.6% of the Severe OSA group.

Conclusions: When the severity of OSA increases, then vitamin deficiencies, becomes more pronounced (but not significant). Thus subjects with more severe OSA indices tended to present lower vitamin D levels; furthermore Vitamin D deficiency may play a role and/or worsen OSA’s. We need to study more OSA adverse outcomes on glucose metabolism, in relation to vitamin D deficiency & insufficiency, as may be considered for supplementation treatment.

Introduction

Vitamin D facts

Vitamin D is often referred to as the sunlight vitamin, because skin or dermal synthesis is the main manufactures and is the major natural source, Pre-vitamin D3 is synthesized non-enzymatically from 7-dehydrocholesterol during exposure to the ultraviolet (UV) rays in sunlight, then undergoes a temperature-dependent re-arrangement to form vitamin D3 (cholecalciferol). Vitamin D is also present in Very few and limited foods naturally, including dairy products, fatty fish like tuna and fortified breakfast cereals [1]. Thus It’s often hard to meet daily requirement of vitamin D from food sources alone, thus may increase risk of a vitamin D deficiency if individuals receive limited exposure to sunlight. Dietary vitamin D is incorporated into micelles, absorbed by enterocytes, and then packaged into chylomicrons. Thus Disorders associated with fat malabsorption, such as celiac disease, Crohn disease, pancreatic insufficiency, cystic fibrosis, short gut syndrome, and cholestasis liver disease, are associated with low serum 25-hydroxyvitamin D (25[OH]D) levels.

Vitamin D is a hormone that interacts with intra-nuclear receptors to effect transcriptional changes in many cell types including those in gut, bone, breast, prostate, brain, skeletal muscle, and the immune system.

Vitamin D deficiency or Inadequacy of vitamin D is widely prevalent, may place individuals at a higher risk of bone weakness and leads to the classic diseases of bone demineralization problems, nonspecific pain and non-inflammatory skeletal myopathy, as well as to more recently recognized linked to a higher incidence of certain types of cancer, depression and obesity.

Furthermore Emerging lines of evidence suggest that low vitamin D levels increase the risk for autoimmune disease, chronic rhinitis, adeno-tonsillar hypertrophy, airway muscle myopathy, and/or chronic rhinitis, cardiovascular disease, and diabetes, all these conditions are mediated by altered immunomodulation, increased propensity to infection, and increased levels of inflammatory substances, including those that regulate sleep, such as tumor necrosis factor alpha (TNF-α), interleukin (IL)-1, and prostaglandin D2 (PD2) [2].

Vitamin D plays an important role in the brainstem control of sleep [3], which is supported by the presence of vitamin D receptors in the anterior and posterior hypothalamus, substantia nigra, midbrain central gray, raphe nuclei, and the nucleus reticularis pontis oralis and caudalis, which these same areas are considered to play a role in the initiation and maintenance of sleep, thus all of which may be key causes of the development of symptoms of daytime wake impairment with sleep disrupted disorders, and sleep apnea.

Many multiple social changes, including the use of air conditioning and sunscreen, have produced a world-wide epidemic of vitamin D deficiency and study the relation between sleep and vitamin D is found to be mandatory, and require attention of the research community.

Sleep Apnea Facts

Obstructive sleep apnea/hypopnea syndrome (OSAHS) is a highly prevalent disorder with multiple comorbidities.

OSAHS is characterized by repetitive episodes of airflow reduction (hypopnoea) or cessation (apnoea) due to upper airway collapse during sleep [4]. Its major risk factor is obesity. However, its pathogenesis is complex and multifactorial. Reduced upper airway muscle tone and/or unstable neuromuscular output seem to be involved in this collapsus.

A normal vitamin D status is necessary for normal muscle function and neuromuscular output. As obesity is associated with a high rate of hypo-vitaminosis D, it appears of interest to evaluate the association between presence and severity of OSA and vitamin D level. Some practitioners, such as neurologist Stasha Gominak, believe that vitamin D deficiency can cause sleep apnea and other sleep disorders. Vitamin D supplementation may help, although clinical research evaluating this claim is still ongoing [5,6]. The aim of our study was to investigate the prevalence of between serum 25-hydroxy [25 (OH)] vitamin D levels and severity of disease in patients with OAS, among the cosmopolitan (multi-national) population of Dubai, United Arab Emirates.

Methodology

The study consists of 269 patients, represents the multi-national and cosmopolitan community of Dubai, United Arab Emirates (UAE), those who were referred to the sleep clinic in Rashid Hospital – Dubai Health Authority (DHA) for investigation of obstructive sleep apnea (OSA), were at the same time investigated for the serum level of vitamin D.

Patient with OSA were classified depending on Apnea Hypoapnea index (AHI) score on the sleep study, according to the American Academy of Sleep medicine scoring and classification criteria and guidelines, in to, no OSA if AHI were below 5, mild if AHI were between 5-15, moderate if AHI were 15-30 and severe if AHI were above 30. While serum level of vitamin D were classified, depending on serum level referring to American college of endocrinology criteria and guidelines, into, of normal value if above 30, insufficient if below 30, and deficient if below 10, Then percentage calculation were performed to estimate the relevance of OSA and Vitamin D deficiency or insufficiency and represented in table, further subcategories of patients performed and calculation done to explore the similar percentages, among local UAE nationals and expatriates UAE residents, and further comparisons.

Results

The study consists of 269 patients of which 45% are in the age group 40 to 60 years, 28% are older than 60 years and 27% are between 14 to 39 years, 53.2% are female and 46.8% are males, with 73% of the participating patients are local UAE Nationals and 27% are expatriate UAE residence patients (Table 1).

Out of the 59 patients with No OSA, 17.9% are Vitamin D deficient and 26.8% are Vitamin D insufficient. On the other hand the remaining who had OSA, 11.8% of the Mild OSA group, 7.3% of the moderate OSA group and 7.9% of the Severe OSA group are Vitamin D deficient (Table 2).

At the same time 30% of the Mild OSA group, 39% of the moderate OSA group and 31.6% of the Severe OSA group are Vitamin D insufficient (Table 3).

When we looked at the 144 patients who had the vitamin D level checked, we found that; 23 patients had normal vitamin D levels, 84 patients had vitamin D insufficiency and 30 patients had vitamin D deficiency [7].

Out of the 30 patients with No OSA, 13.3% had normal vitamin D, 53.3% had vitamin D insufficiency and 33.4% had vitamin D deficiency. Of the 45 patients with mild apnea, 13.3% had normal vitamin D, 62.3% had vitamin D insufficiency and 24.4% had vitamin D deficiency. While among the 23 patients with moderate apnea, 17.5% had normal vitamin D, 69.5% had vitamin D insufficiency and 13% had vitamin D deficiency. In the 39 patients with severe sleep apnea we found 23% had normal vitamin D, 61.5% had vitamin D insufficiency and 15.5% had vitamin D deficiency in general. There was no statistically significant difference in serum 25(OH)D levels between OAS and controls (p>0.05) (Table 4).

Of these 144 patients who had the vitamin D level checked, 23 patients had normal vitamin D levels ,out of them 17.4% with No OSA, 26% with mild oasa, 17.4% with moderate oasa and 39% with severe oasa [8]. Of the 84 patients with vitamin D insufficiency, we found 19% with No OSA, 33.3 % with mild OSA, 19% with moderate oasa and 28.7% with severe oasa, While among the 30 patients with vitamin D deficiency we found 33.4% with No OSA, 36.6 % with mild oasa, 10% with moderate oasa and 20% with severe oasa.

In this subgroup analysis of OAS, we found that the patients with severe OSAS had significantly lower levels of 25(OH)D as compared with other groups (p=0.003).

Also, the number of patients with serum 25(OH)D deficiency (<10 µg/dl) were higher in OSAS group than in controls (p<0.05) (Table 5).

Discussion

Many clinical studies emphasized the direct relation between increased incidence of insulin resistance (IR) [9,10], type two diabetes mellitus (type 2 DM) and OSA. Obesity is known to be an important risk factor for both OSA and abnormal glucose metabolism.

There is growing evidence suggesting that low-grade systemic inflammation may serve as the mechanistic link between OSA and metabolic disorders including IR. Vitamin D insufficiency has long been suspected as a risk factor for glucose intolerance and diabetes. The serum concentration of 25-hydroxyvitamin-D3 (25-OH-D), which also defines the nutritional status, was shown to be lower in obese and/or diabetic patients and in those who were at high risk for diabetes. Adipose tissue, which is a well-known source of inflammatory cytokines, may be responsible for the decreased bioavailability and enhanced metabolic clearance of vitamin D in obese subjects.

Many arguments can be presented in the recent few years regard the association and relation of vitamin D to different medical and sleep disorders. In fact although there is an anatomic and epidemiological...
Age groups (years) | Frequency | Percent
---|---|---
14 to 39 | 74 | 27.5
40 to 60 | 120 | 44.6
Older than 60 | 75 | 27.9
Total | 269 | 100

Sex | Frequency | Percent
---|---|---
Female | 143 | 53.2
Male | 126 | 46.8
Total | 269 | 100

Nationality | Frequency | Percent
---|---|---
Local | 197 | 73.2
Non local | 72 | 26.8
Total | 269 | 100

BMI groups | Frequency | Percent
---|---|---
<20 | 11 | 4.1
20 – 30 | 54 | 20.1
30 – 40 | 97 | 36.1
40 – 50 | 64 | 23.8
Above 50 | 39 | 14.5
Data not available | 4 | 1.5
Total | 269 | 100

OSA/No OSA | Frequency | Percent
---|---|---
OSA | 210 | 78
• Mild | 93 | 34.5
• Moderate | 41 | 15.2
• Severe | 76 | 28.3
No OSA | 59 | 22
Total | 269 | 100

Table 1: The study showed 45% of the patients % are in the age group 40 to 60 years and only 20% of them had a normal BMI.

Table 2: The study showed 78% of the patients have Obstructive Sleep Apnea (35% have mild OSA, 15% have moderate OSA and 28% have severe OSA), and 22% do not have OSA.

Table 3: The relationship between vitamin D level and sleep apnea finding in all 269 patients.

connection between sleep disorders and vitamin D deficiency, makes little sense if vitamin D's actions are thought to be limited to bone and calcium metabolism.

The results in this study showed no obvious relation, other than worsening symptoms or severity of OSAS, thus a patient with OSAS do suffer more if they had Vitamin D deficiency, it is may considered as augmenting effect but not causative effect. Thus furthermore would difficult to treat or tolerate CPAP, may benefit from vitamin D supplement this prompt other clinical studies and trials to answer, as synergistic effect, although may or should not replace or over took CPAP. Vitamin D supplementation was shown to improve insulin release and action in some studies; however, it is controversial. Regarding to these mechanistic links, vitamin D deficiency may have a potential role in pathogenesis and/or metabolic outcomes of OSA in terms of inflammatory response and IR. The therapeutic effects together with the anatomic–functional correspondence warrant further investigation and consideration of vitamin D in the etiology and therapy of sleep disorders.

Furthermore totality of vitamin D actions are need to be understood, then it may seems sense to that the hormone that links us to the sun would also affect circadian sleep cycle, taking in consideration indirect or overlapping effect of vitamin D on other metabolic syndrome which may associate or cross over with the effect may result from OSAS on those metabolic disorders as Diabetes Mellitus and obesity.

Summary

When the severity of OSAS increases, vitamin D deficiency or insufficiency becomes more pronounced. Thus subjects with more severe OSA indices tended to present lower vitamin D levels; furthermore Vitamin D deficiency may play a role and/or worsen OSA’s. We need to study more OSA adverse outcomes on glucose metabolism, in relation to vitamin D deficiency & insufficiency, as may be considered for supplementation treatment which was shown to ameliorate abnormal glucose metabolism and inflammation.

Obstructive sleep apnea (OSA) and vitamin D deficiency are
two separate disorders associating with obesity, inflammation, and impaired glucose metabolism. Much remains to be learned concerning the complex relationship between chronically low levels of vitamin D, normal sleep, sleep disruption, and daytime neurocognitive impairment.
