Abstract

In this article we offer to enhance the standard model of a bosonic superconducting cosmic string and model it in our quantum harmonic system to enable the creation of flexible (folded) quantum computers, iPhones and TVs, engineless quantum transmission and propelling devices for cars and aircrafts, super fluid propulsion, levitation and teleportation.

Keywords: Bosonic; Tunnelling; Cosmic; Fermionic; Teleportation; Quantum computers

Elaboration

Accordingly, and contrary to the common bosonic string model in Figure 1, we model our ultracold hollow cylindrical superstring (Figure 2) as a space time piercing string within the overlapping counter-rotating magnetic fields. (Compare with the space time piercing ability of neutrinos and their left-right counter-spinning ability).

Our tunneling superstring system in Figure 2 consists of the open left entry to trap fermionic atoms in the vacuum vortex core, harmonizes them in vertex by shifting counter-rotating magnetic fields in a quasi Casimir effect to unify them in a superimposed magnetic field in quantum squeeze junction (Figure 3), and then superconducts them via superstring's right exit in mass propagation [1-3]. The system in Figure 3 functions similar to a musical squeezebox harmonika or accordion (see image below) which expands and contracts its bellows by using trapped air to create pressure and vacuum and produce musical sounds [4].

Accordion

Similarly to accordion functions, our quantum harmonic system

in Figure 3 shifts external magnetic fields back and forth over ultracold Majorana fermions trapped and compressed in the rotating tube of the superconducting superstring. In the lab, such a system can be represented by a vacuum tube with numerous counter-rotating electromagnets sliding back and forth over the tube and its trapped ultra cold particles. To make this system work as a cold fusion reactor, we would direct the particles beam from our quantum harmonic generator into the chamber with liquid helium and neon to interact there with solar neutrinos [5,6]. Our quantum model represents the classical and quantum motion of photons, etc. in a rotating string. The spin motion per Bargmann-Michel-Telegdi equation is considered in the rotation tube and rotating system in acceleration of charged particles. In fact, neutral particles photons, neutrons, etc. can be accelerated by rotating tube. The specific characteristics of the mechanical systems in the rotating framework follow from the differential equations describing the massive body in the noninertial systems.

Let be the Lagrange function of a point particle in the inertial system as follows:

$$m = \frac{d_{x0}}{d_t} = \frac{\partial U}{\partial r'} \quad L_0 = \frac{mv_0^2}{2} - U$$

With the following equation of motion

$$m = \frac{d_{v0}}{d_t} = \frac{\partial U}{\partial r'}$$

Conclusion

Because our ultra cold superstring is nonrelativistic, it is not constrained to the multidimensional spacetimes in which superstrings are usually studied in high-energy physics. It is the first harmonic condensed matter system proposed, where super conductivity in macroscopic quantum phenomena can be studied experimentally. Accordingly, our theory and model enable to create a super fluid propulsion system, quantum computers, iPhones and TVs, nanoturbines for cars, aircrafts and power stations, and quantum generator for portable cold fusion energy. In further application of our technology, new class of vehicles can be operated in levitation and superfluid propulsion, and energy teleported. Moreover, In

our quantum model, physical/molecular data of the object can be photonicly compressed, tunneled via our quantum tube and then amplified/reassembled at given destination. The eternal question: why cosmic strings aren't detected by gravitational waves, is answered in assumption that in a quantum state, such mini strings never meet or spark, and function at zero point gravity, in anti-gravity or repelling gravity. Such cosmic mini strings create mini black holes, and hence cannot be detected by gravitational waves. When twin superstrings of matter create a macroscale black hole, as explained in our 11 pp. Theory of Unified Matter, we might detect them by gravitational waves.
