2Lipogen Ltd., Haifa, Israel

Abstract

Phosphatidic acid (PA) and phosphatidylserine (PS) and are natural constituents of healthy brain cell membranes, which have been recognized since the 1970s as essential to normal neuronal functioning. PA is a precursor in the formation of other phospholipids, including PS and phosphatidylethanolamine (PE). Also, it has an impact on membrane rigidity/flexibility, which is important in modulating exo- and endocytosis. PS is also an important precursor for PE synthesis. Since PS predominantly occurs in brain cells, but normal diets do not include the consumption of brains, PS is available to our brains mostly via natural “production” in our bodies.

Here, we present a tabulated literature survey of clinical studies on PS and/or PA regarding brain function in elderly people. In addition, we give a summary on two of our already published pilot studies performed with a brain-health food supplement containing a proprietary blend of 100 mg PS and 80 mg PA produced from soy lecithin: A three-month double-blind, placebo-controlled study demonstrated the positive influence of three PS+PA capsules/day (300 mg PS+240 mg PA per day; n=40) or placebo (n=32) on memory and mood in functioning, non-depressive elderly people with memory problems. In a two-month randomized, double-blind, placebo-controlled study, three PS+PA capsules/day (300 mg PS+240 mg PA per day; n=56) or placebo (n=40) improved daily functioning, mental health, emotional state, and self-reported general condition in patients with Alzheimer’s disease (AD).

Altogether there is encouraging clinical data that PS+PA supplementation could be beneficial to AD patients and other elderly people with memory or cognition problems. Long-term studies are, however, still lacking.

Phosphatidylserine (PS) and Phosphatidic Acid (PA) in Memory

The membrane phospholipids phosphatidic acid (PA) and phosphatidylserine (PS) are essential to cellular functioning, acting as a biological detergent, keeping fatty substances soluble and cell membranes flexible [1,2]. During the pathogenesis of several age-related neurodegenerative diseases, including Alzheimer’s disease, the neuronal membrane lipid composition is altered in the brain [3,4]. Also, the lipid raft composition appears to be altered in neurodegenerative diseases [5].

PS (and PA), produced by enzymatic conversion of soybean lecithin, avoids possible regulatory and safety issues regarding bovine lecithin, avoids possible regulatory and safety issues regarding bovine lecithin, avoids possible regulatory and safety issues regarding bovine lecithin, avoids possible regulatory and safety issues regarding bovine lecithin, avoids possible regulatory and safety issues regarding bovine lecithin, avoids possible regulatory and safety issues regarding bovine lecithin, avoids possible regulatory and safety issues regarding bovine lecithin, avoids possible regulatory and safety issues regarding bovine lecithin, avoids possible regulatory and safety issues regarding bovine lecithin, avoids possible regulatory and safety issues regarding bovine lecithin. For both studies, informed consent of the participants was obtained, and the studies complied with the Helsinki Declaration of 1996. However, an ethics committee vote was omitted since it was not mandatory at the time.

To selectively dampen stress levels [16-18], improve learning and perception parameters in children with attention deficit hyperactivity disorder (ADD) [19,20], and improve calculation speed of athletes [21]. Table 1 summarizes previously performed studies on PS and/or PA regarding brain function in the elderly.

Summary of Two Previously Published Pilot Studies on PS & PA

In the following, we summarize the clinical results from a recent publication on clinical effects of dietary soy lecithin-derived PS+PA supplementation (manufactured by Lipogen Ltd. (Haifa, Israel) within two placebo-controlled studies on elderly people with memory impairment or dementia [23]. These studies were performed between 1992 and 1999, and were, to our knowledge, the first studies performed with plant-derived PS. For both studies, informed consent of the participants was obtained, and the studies complied with the Helsinki Declaration of 1996. However, an ethics committee vote was omitted since it was not mandatory at the time.

Recently, oral administration of phosphatidylcholine/phosphatidylethanolamine (PE) -transphosphatidylated PS has been shown to improve memory impairment in aged rats [6]. Also, other experiments have shown an improvement in memory, learning capacity, and other cognitive parameters in PS-supplemented rodents [7-11]. This is plausible, since PS was found to stimulate neurotransmitter release [7,12], increase brain glucose metabolism [13,14] and reduce oxidative stress in the brain [15].

In clinical studies, PS-containing preparations were found to selectively dampen stress levels [16-18], improve learning and perception parameters in children with attention deficit hyperactivity disorder (ADD) [19,20], and improve calculation speed of athletes [21]. Table 1 summarizes previously performed studies on PS and/or PA regarding brain function in the elderly.

Study 1: Effect of PS+PA on memory and mood in functioning elderly

In 1992, elderly male and female residents (aged 60–80 years) of three Israeli rural collective communities (Kibbutzim Givat Brenner, Gat, and Galon), with memory problems in daily life were randomly included in this placebo-controlled study. The subjects were not demented, achieving at least 25 out of 30 on the Folstein Mini-Mental State Examination (MMSE) [33]. Also they were not depressed or suffering from any major disease, and were not taking medication with influence on memory.

For 3 months, the subjects took soy lecithin-derived PS (100 mg) and PA (80 mg) (“L-Telect”, Lipogen Ltd., Haifa, Israel: similar to current Lipogen PS Plus® & MemreePlus™) tid (40 ITT/31PP subjects) versus placeboA therapeutic effect of PS was observed: Bovine brain derived PS (300 mg/d) versus placebo (300 mg/d) versus placebo

Peri Scale

There was a trend toward improvement in the placebo group relative to placebo in

Supplemented subgroup with low level cognitive impairment or cognitive training only, or +cognitive training or pyritinol 2 x 600 mg/day +cognitive training or

Soy derived PS (100 mg tid) for 3 months, the subjects took soy lecithin-derived PS (100 mg)

Cognitive improvement in the placebo group was not significant. The supplemented subgroup with low level cognitive impairment or cognitive training only, or +cognitive training or pyritinol 2 x 600 mg/day +cognitive training or

Soy derived PS+PA supplementation No adverse effects, significant positive influence of PS in most cognitive categories in pre-post-comparison

No significant cognitive improvements in any group

Significant positive effects on cognitive function

PS treatment had an effect on different measures of brain function, with best effects after 8 and 16 weeks.

Suplemented subgroup with low memory scores significantly improved regarding memory, compared to baseline, while elderly in the placebo group remained unchanged

In AD patients, vocabulary and picture naming tasks improved, relative to placebo in daily life learning and memory tasks

A therapeutic effect of PS was observed: acceleration of a slowed EEG

Improvement on neuropsychological tests in the PS-supplemented subjects relative the placebo group

There was a trend toward improvement in the PS treated patients: analysis of covariance showed a significant treatment effect on the Peri Scale

Significant positive effect on daily functioning, positive trends on emotional state and on self-reported general condition, no adverse effects

No adverse effects, significant positive influence of PS in most cognitive categories in pre-post-comparison

AD Alzheimer’s disease, AAMI, Age associated memory impairment, PA Phosphatidic acid, PS Phosphatidylserine, tid Three times daily.
on memory performance. The Wechslar Memory test (WMT; without age correction) was used to examine memory, learning, association, and information gathering as distinct from intelligence [34]. Both placebo and PS+PA group had (as expected) a significant test-retest improvement in total WMT scores in the testing at the end of the study (P<0.005). However, the PS+PA group, compared to the placebo group, reached a higher degree of significance, see Figure 1A. In pre- and post-comparison of components of the memory test, none of the placebo group’s changes were statistically significant – in contrast, results for maintaining information, visual memory, and memorizing numbers improved with a statistical significance of P<0.05 within the PS+PA group.

When comparing the scores between groups, only trends in favour of the PS+PA group could be observed, possibly due to the rather small study size and its relatively short duration. However, subjects on PS+PA supplementation with a high initial WMT score showed more significant memory improvements, whereas those who had scored low did not, see Figure 1B.

Mood was additionally tested using the LDS [35]. The resulting score was also used to exclude those with a score of <17 during recruitment. Subjects in the PS+PA group did not have any significant mood changes from baseline (late summer/early fall) to the end of the study in (late fall/winter), however in the placebo group a seasonally expected mood deterioration was observed (P<0.001 in pre-post comparison). This is consistent with a different report that PS had a positive effect on geriatric depression [36].

**Study 2: Effect of PS+PA on daily functioning and general condition in 96 patients with AD**

A two-month double-blind, randomized, placebo-controlled trial was performed on patients diagnosed with definite-probable AD (Alzheimer’s Disease and Related Disorders Association) in 1995. Men and women aged 50-90 years were recruited from the Kaplan Medical Centre (Rehovot, Israel), from kibbutzim near Rehovot, and the Israel Association of Alzheimer’s Disease. 56 patients were allocated to 100 mg of PS+80 mg PA mixed with lecithin tid ("L-Telect", Lipogen Ltd., Haifa, Israel) (53 PP patients); 40 patients to placebo (starch) (39 PP patients). The two randomized groups were comparable at baseline.

PS+PA had clear beneficial effects in patients with dementia, especially if the expected gradual cognitive deterioration is taken into consideration:

support memory and cognitive function, especially in people with cognition and memory deficiencies. Possibly, significance in some of the parameters was not reached due to the short study duration and the limited sample size. Similarly, encouraging results were also published in a number of other studies (Table 1).

Discussion

Regarding elderly people with memory impairment or dementia, there are promising clinical data, especially for the supplementation of PS (Table 1). In addition, there is an emerging understanding on how the phospholipid pattern is linked to brain function, or its decline: Mild cognitive impairment and AD have been linked to oxidative stress and corresponding lipid peroxidation within the brain [37]. Oxidative stress on neuronal membranes also has a detrimental effect on synaptosomal PS asymmetry, which is normally maintained by the ATP-requiring enzyme flipase [38]. Accordingly, the appearance of PS in the outer membrane leaflet is a signal of synaptosomal apoptosis, which was also observed in brain post-mortem autopsies of patients with mild cognitive impairment and AD [39]. Next to the PS distribution, also its overall level is likely to have an impact: In PC12 cells with induced apoptosis, a reduction in the level of PS was detectable before the detection of apoptosis [40].

The supplementation of PS may also have an impact on PE levels, since in mammalian cells PE is synthesized also by PE dcarboxylation in the mitochondria [41]. PA is not only a precursor for other phospholipids, but also plays a pivotal role by influencing membrane fluidity, which is especially important for vesicle formation, e.g. during neurotransmission [42]. However there is only limited clinical evidence regarding PA supplementation in elderly people with dementia or age associated memory impairment.

Altogether, long-term investigations on PS+PA supplementation are needed. In most countries, regulatory issues prevent the supplementation of PS+PA for patients with AD, since this is a medical indication – this problem could only be solved by adapting regulations, or by including PS and PA into a drug product, and filing a full drug dossier, which in turn will require more extensive clinical studies.

Author Contributions and Conflict of Interest

The results on plant derived PS+PA were previously reported [23].

Here, we summarize our main findings and give an update on related literature. The authors cooperated on writing this article. D. Rutenberg in an employee of Lipogen Ltd (Haifa, Israel), M. I. Moré, is an employee of analyze & realize GmbH, Berlin, Germany.
