Abstract
The purpose of this study was to determine the attitudes of mouthguard users in the 2009 International Ice Hockey Federation (IIHF) Word U18 Championship Div. III Group B Turkey. The participants’ appreciation in the use of protective devices, such as mouthguards, during sport activities was also evaluated. In this study a 10-item questionnaire was distributed to 82 athletes of ice hockey in 2009 IIHF Word U18 Championship. The Championship composed of 4 national teams [Bulguria (Bul), Ireland (Irl), Iceland (Isl) and Turkey (Tur)]. Of all players were males and there average ages were Bul. 16.55, Irl.16.2, Isl. 17.0, Tur. 17.3. The result of questionnaires indicated that none of the athletes used mouthguards while participating in sports. The use of mouthguards is rare in sports, because all of the athletes wear helmets and face masks associated with their helmets. IIHF rules required that athletes, who fewer than 18 years, should wear face masks during sport activities, but not mandatory of wearing mouth guards. The same 10-item questionnaire was distributed to 16 athletes of national ice hockey team of Turkey. Athletes, who are older than 18 years, usually wear not face masks but wear helmets and mouthguards. There sportsmen’s 25% used mouthguards while participating in sports, but this number is not enough. Doctors and dentists need to recommend a more intensive education of athletes in sports medicine and sports dentistry.

Keywords: Mouth guard; Orofacial injury; Ice hockey

Introduction
Dental injuries are the most common type of orofacial injury sustained during participation in sports [1-3]. The current public popularity of contact sports and the willingness to take high risks in sport have led to an increase in sport injuries [4-8]. Sporting accidents are one of the most common causes of facial injuries. Studies on large groups have shown that sports account for 31% of such trauma in adults and children [9,10]. When the face and head are involved, this often results in tooth or mouth trauma. A blow to the face can not only cause tooth or soft tissue injuries, but can also result in fractures of the jaw or facial bones, or even cerebral damage. The subsequent esthetic, functional, psychological, and economic impact (often with high follow-up costs) demonstrate the importance of prevention. Different studies have demonstrated that wearing a mouthguard can significantly reduce the incidence of orofacial injuries [4,11-15]. Athletic mouthguards were used extensively for the prevention of intraoral trauma in sports [16,17]. The increasing popularity of all sporting events results in an increased potential for injuries across a wide range of both organized and unorganized sports [18,19]. Since the 1950s, mouthguards have been mandated in US American football at high school and college levels. In 1962 the National Alliance Football Rules Committee enacted a rule to mandate the use of facemasks and mouthguards for the first time for football players in high school and college. Heintz reported that in the US this regulation has mandated in US American football at high school and college. Duymuş and Güngör [25] report that none of the students of these Turkish coaches use mouthguards during sport activities. The purpose of the present study was to determine the extent of mouthguard use, as well as the frequency of oral trauma in these athletes.

Materials and Methods
The aim of this study was to determine the attitudes of mouthguard

users in the IIHF World U18 Championship Div. III Group B Erzurum in Turkey on 09-15 March 2009. In this study a 10-item questionnaire was distributed to 82 athletes of ice hockey in 2009 IIHF World U18 Championship. The study not only consisted of 82 athletes of ice hockey in 2009 IIHF World U18 Championship but also consisted of 16 athletes of ice hockey all of whom were selected from national ice hockey team of Turkey when they camp out in Erzurum on March 2009. These athletes were answered same questions. The Championship composed of 4 national teams [Bulgaria (Bul), Ireland (Irl), Iceland (Icl) and Turkey (Tur)]. Interviews were conducted with 82 athletes of ice hockey who are younger than 18 years and 16 athletes of ice hockey who are older than 18 years. Table 1 represents the athletes’ questionnaire which was developed from previous surveys [18,25-28].

Results

Interviews were conducted with 82 ice hockey athletes on Bul., Irl., Isl. and Tur. U18 national teams. Of all players were males and there average ages were Bul. 16.55, Irl. 16.2, Isl. 17.0, Tur. 17.3. Each athlete was asked a series of questions concerning the use of a mouthguard, whether a mouthguard was owned, and any history of oral trauma while participating in sports. Positive responses prior to trauma were qualified concerning the type and location of the injury. Because none of the athletes who fewer than 18 years have a mouthguard, the athletes were not asked whether they had any complaints while wearing the mouthguards. The participants’ use of a mouthguard during games was also encouraged. Results Table 2 shows the teams, distribution of athletes, average years and dental trauma of athletes. All of them were males. None of them had used a mouthguard and suffered any orofacial injury in this championship. The use of mouthguards is rare in sports, because all of athletes wear helmets and face masks associated with their helmets. IIHF rules required that athletes, who fewer than 18 years, should wear face masks during sport activities, but not compulsion of wearing mouthguards. Athletes, who older than 18 years, usually wear not face masks but wear helmets and mouth guards. The results of the Athletes, who are older than 18 years, questionnaires are given in Table 3. Average year of sportsmen is 20.94 and their 25% used mouth guards while participating in sports. All of types of mouth guards are mouth-formed mouth guard. All of them were males.

Discussion

Injuries to the orofacial area often mean lifelong squeal with considerable follow-up costs. Different studies have shown that such injuries could be prevented by wearing a mouthguard [6,26-29]. Stenger et al. [30] reported that in football, with the introduction of face masks, dental injuries were reduced to almost half (50%) and with the addition of mouthguards the number of dental injuries in this sport decreased to 1.4%. The present study examined the type and frequency of orofacial injuries and the use of mouthguards by ice hockey athletes in the 2009 IIHF World U18 Championship. Furthermore, the attitude of officials towards the use of mouthguards was analyzed. In line with previous studies [14,31,32], there are large variations between the different sports concerning the acceptance of wearing a mouthguard.

Although over 40% of all players approved the use of a mouthguard, none actually used one. The most common injuries reported were soft tissue lacerations and tooth fractures. Surprisingly in soccer, cerebral concussion was a common finding. The use of mouthguards as a necessity in soccer, despite the relatively low rate of orofacial injuries, remains a controversial issue. In fact, the study by Labella et al. [33] could not show any differences in the concussion rate of basketball players with or without mouthguards. The orofacial trauma rate in this study group was 0%. Further research is needed to determine the risk of orofacial injury in all contact sports in Turkey. In the present survey, it was found that the level of usage, knowledge, and awareness regarding the benefits of using mouthguards in this championship are minimal. IIHF and other all federations of contact sports should be required to wear mouthguard for athletes. Dentists as well as other healthcare professionals should educate players and his parents in order to promote the use of mouthguards in professional and amateur sports, especially for adolescents. Dental professionals, especially pediatric dentists, should regularly question patients’ parents about sports participation and inform them about orofacial injury risk and suggest the use of a mouthguard.

Conclusion

The study showed that the majority of ice hockey athletes agree on the benefits of mouthguards but their knowledge is limited. Likewise,
sport activities should be promoted. If mouth guard is increased the protection of intra-oral injuries. It was
during sports. Face mask maybe protection to dental injuries but using
celebrated that the using of face mask protection to dental injuries
information about professionally fitted mouthguards. These athletes
do not use mouthguards and they do not have much
these do not use mouthguards and they do not have much information about professionally fitted mouthguards. These athletes
cerated that the using of face mask protection to dental injuries
during sports. Face mask maybe protection to dental injuries but using
of mouth guard is increased the protection of intra-oral injuries. It was
concluded that the use of mouthguardings during professional or amateur
sport activities should be promoted.
